

Lecture 2

Law of Comparative Advantage

What kind of products does Vietnam export?
What does Vietnam import? Why?

Dr. Vu Thanh Huong
Faculty of International Business and Economics
University of Economics and Business, VNU

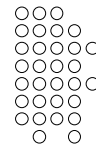

Evolution of International Trade Theory

**Comparative
advantage
David Ricardo**

Mercantilism

**Absolute
advantage
Adam Smith**

- H-O
- Product life cycle
- New trade theory
- National Competitive Advantage

Lecture overview

Mercantilism

The theory of Absolute Advantage

The theory of Comparative Advantage

Opportunity Cost Theory

3

Overview of Mercantilism

Historical context

- Mercantilism the oldest perspective
- XV-XVI: England
- XVII: France, Germany, Portugal, Netherlands...
- XVIII
- Capitalism: newly born

Vu Thanh Huong

4

Mercantilism's views on trade

Nature of the wealth of a nation

- Stock of precious metals (Gold, silver...)
- Precious metal => unique assets => accumulate gold and silver
- Why???

Trade

- The way to create wealth => Important role of trade
- Should maintain trade surplus
 - Export more than import => richer
- Vietnam's trade balance

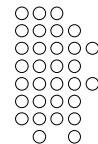

Good or bad?

Vu Thanh Huong

5

Mercantilism's views on trade (cont.)

Government intervention on trade activity

- Advocate government intervention
- Maintain the trade surplus
- How to intervene?
 - Stimulate exports
 - Discourage imports

Trade is a zero-sum game

- One nation gains at the expense of other nations

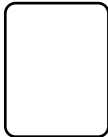

Vu Thanh Huong

6

Evaluating Mercantilism's views on trade

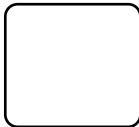

Contribution of Mercantilism

- The oldest, pioneer theory on IE
- Recognize the role of trade
- To emphasize the government role in regulating trade

Limitations

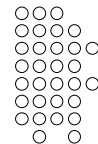

- Nature of wealth of a nation
- Zero-sum game
- Government control

Vu Thanh Huong

7

Neo-mercantilism

- Is Mercantilism's view on government control alive?
 - Case study 2-2
 - A late 20th century form of mercantilism – Neo-mercantilism
 - Japan, the EU and the US.
- "Neo" because of
 - The late 20th century form of mercantilism
 - **the change in emphasis** from classical mercantilism on military development, to economic development.
- Neo-Mercantilist thinking is very much alive today.
 - It now has a sharp focus on employment. Neo-mercantilists believe that exports are good because they create jobs in the country, and imports are bad because they take jobs from the country.
 - Neo-mercantilists continue to depict trade as a zero-sum activity

8

Neo-mercantilism (cont.)

- a policy regime
 - encourages exports
 - discourages imports
 - controls capital movement
 - centralizes currency decisions
- objective of neo-mercantilist policies
 - increase the level of foreign reserves
 - allow more effective monetary policy and fiscal policy.

in the hands of
a central
government.

Vu Thanh Huong

9

Lecture overview

Mercantilism

The theory of Absolute Advantage

The theory of Comparative Advantage

Opportunity Cost Theory

10

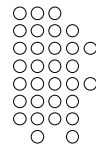

Adam Smith

- Adam Smith (1723 – 1790)
 - The Wealth of Nations (1776) – Magnum opus
 - Father of modern economics
- Attack the mercantilism's views on trade
 - Nature of wealth of a nation
 - Zero – sum game
 - Government intervention

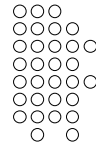

Assumptions

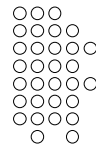

- 2 countries
- 2 goods
- Labor: only production factor
- No barriers to trade
- No transportation cost
- 3 questions???

Basis for trade

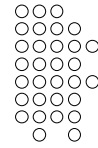

- Absolute advantage
- A country has absolute advantage in producing a particular good if it is **more efficient** than the other country in producing that good.
- More efficient: higher productivity of labor, lower labor cost.
 - E.g.
 - Scotland needs 30h/ shirt and 120h/automobile
 - England needs 100h/shirt and 20h/ automobile
 - Identify absolute advantage of each country?
- Sources of absolute advantage:
 - Natural conditions: Vietnam, Australia
 - Expertise: Japan

Pattern of trade

- Countries should specialize in the production of goods for which they have an absolute advantage
- Countries should export goods which they have an absolute advantage
- Countries should imports goods for which they have an absolute disadvantage
- E.g: Scotland and England

Gains from trade

- Both nations will benefit
 - Resources are utilized efficiently
 - Output of both commodities increase

Illustration of the Absolute Advantage

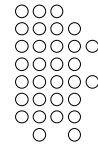

• Table 2.1: Productivity

	The US	Vietnam
Steel ((ton/hour)	10	1
Rice (ton/hour)	1	20

- Identify
 - Absolute advantage of each country
 - The pattern of trade.
 - Gains from trade.

Vu Thanh Huong

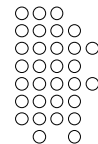

Illustration of the Absolute Advantage (cont.)

- Absolute advantage of each country
 - The US has an absolute advantage over Vietnam in steel production
 - Vietnam has an absolute advantage over the US in rice production

Vu Thanh Huong

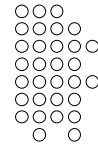

Illustration of the Absolute Advantage (cont.)

- Pattern of trade
 - US specializes in steel production; exports steel; and imports rice
 - Vietnam specializes in rice production; exports rice; and imports steel

Vu Thanh Huong

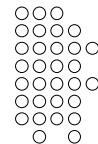

Illustration of the Absolute Advantage (cont.)

- Gains from trade:
 - Assume 1 ton of steel can be exchanged for 1 ton of rice
 - Rate of exchange is 1S : 1R
 - How are large gains of each nation and the world when exchanging 10S:10R?
- Both nations gain from trade
 - The US: better off by 9R or equivalent to 9 hours
 - Vietnam: better off by 190 R or equivalent to 9.5 hours
 - Both gain.

Vu Thanh Huong

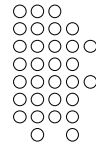

Limitations

- Questions:
 - When each country has an absolute advantage in one product, it is clear that trade is beneficial. But what if one country has an absolute advantage in both products?

	The US	Vietnam
Steel ((ton/hour)	10	1
Rice (ton/hour)	30	20

Limitations (cont.)

- Can not explain trade pattern: If one country has absolute advantages in both products
- Just explain a very small part of the world trade today:
 - trade between developed and developing countries.
 - Trade between nations with different production conditions
- 3 basic questions
 - Basis: Absolute Advantage
 - Pattern: can not explain in some cases

Lecture overview

Mercantilism

The theory of Absolute Advantage

The theory of Comparative Advantage

Opportunity Cost Theory

22

David Ricardo

- David Ricardo (1772 – 1823)
- One of the most influential classical economists.
- Parliament member, businessman, financier and speculator => personal fortune.
- 1799: First contact with economics: The Wealth of Nations
- Principles of Political Economy and Taxation (1817)
 - The labor theory of value
 - Most important contribution: theory of comparative advantage.

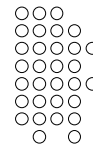

Assumptions

- Two countries (the US and UK)
- Two goods (Steel and rice)
- Labor is the only factor of production and not mobile across the two countries.
- Labor productivity varies across countries, usually due to differences in technology, but labor productivity in each country is constant across time.
- Constant supply of labor
- Perfect competition
- No barrier to trade

Basis of trade

- Comparative advantage
- A nation has a comparative advantage where its absolute advantage is greater, or where its absolute disadvantage is smaller
 - Lower **relative** cost or higher **relative** productivity
 - Compare with absolute advantage?

Basis of trade (cont.)

- Relative cost and Relative productivity

	The United Kingdom	Japan
Automobiles (h/auto)	5	2
Coffee (h/ton)	10	6

- Calculate relative costs or relative productivity of producing automobiles of each country?
 - Relative cost of Japan in producing automobiles = $2/6 = 1/3$
 - Relative cost of the US in producing automobiles = $5/10 = 1/2$
 - Japan has a comparative advantage in producing automobile

Pattern of trade and gains from trade

- Countries should specialize in the production of goods for which they have a comparative advantage
- Countries should export goods which they have a comparative advantage (smaller absolute disadvantage)
- Countries should imports goods for which they have a comparative advantage (greater absolute disadvantage)
- Gains from trade
 - Both nations benefit
 - The world would be better off

Illustration of comparative advantage

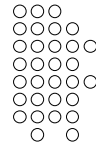

- Illustration of theory of comparative advantage

	The US	The United Kingdom
Steel ((ton/hour)	6	1
Rice (ton/hour)	4	2

- What is the pattern of trade based on concept of absolute advantage?
 - Can not identify
- What is the pattern of trade based on concept of comparative advantage?

Illustration of comparative advantage (cont.)

- Calculate and identify comparative advantage

	US	The United Kingdom
Steel ((ton/hour)	6	1
Rice production	4	2

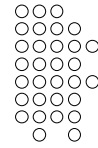

- The US has an comparative advantage in steel production
- The United Kingdom has an comparative advantage in rice production

Illustration of comparative advantage (cont.)

- Pattern of trade:
 - US specialize in the production of steel; export steel; import rice
 - The United Kingdom specialize in the production of rice; export rice; import steel

Illustration of comparative advantage (cont.)

- Gains from trade:
 - assume 1 ton of steel: 1 ton of rice (1S:1R)
 - Calculate gains of each country when exchanging 6S:6R
- Both nations gain from trade
 - The US: better off by 2R or equivalent to 1/2 hour
 - The United Kingdom: better off by 6R or equivalent 3 hours
 - => Both nations gain and even The United Kingdom gain more even it has absolute disadvantage in producing both goods.
- The world gain from trade
 - Reallocate one hour of labor time (Do it)
 - => Attack zero-sum game.
 - => Advocate the policy of laissez-faire and free trade.

- ***Even if a nation has an absolute advantage in the production of both goods, two nations can engage in mutually beneficial trade if each nation specializes in and exports the good in which it has the comparative advantage.***

Vu Thanh Huong

Rate of exchange

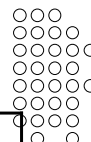

- Rate at which goods can be exchanged
 - 1S : 1 R or 6S: 6R => Mutual benefit
 - If 6S : 4R => US: not participate in trade
 - If 6S : 12 R => UK: not participate in trade
 - The range for mutual benefit
 $4R < 6S < 12 R$

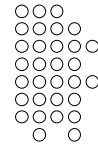

Rate of exchange (cont.)

The gains from trade by the rate of exchange

The rate of exchange between S & R	Gains from trade			Note
	US	UK	World	
6S:3R				No trade
6S:4R	0R	8R	8R	No trade
6S:5R	1R	7R	8R	
6S:6R	2R	6R	8R	
6S:7R	3R	5R	8R	
6S:8R	4R	4R	8R	Equal gain
6S:9R	5R	3R	8R	

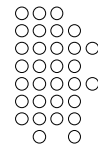

Exception to the theory of Comparative Advantage

	The US	Vietnam
Steel (ton/hour)	6	1
Rice (ton/hour)	12	2

Lecture overview

Mercantilism

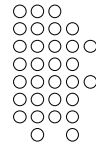

The theory of Absolute Advantage

The theory of Comparative Advantage

Opportunity Cost Theory

36

Historical context

- Limitations of Comparative Advantage Theory
 - No transportation cost and trade barrier
 - Labor theory of value:
 - Labor is the only factor of production
 - Labor is used in the same fixed proportion in production of all commodities
 - Labor is homogeneous
- ⇒ Destiny of comparative advantage theory?
- In 1936, Haberler: opportunity cost (OC) to explain comparative advantage
 - ⇒ the Law of CA is referred as the Law of OC

Opportunity cost

- The opportunity cost of a commodity is the amount of a second commodity that must be given up to release just enough resources to produce one additional unit of the first commodity.
- E.g:
 - go to work or go to university?
- Formular
 - $$OC_A = \frac{Productivity_B}{Productivity_A} = \frac{Cost_A}{Cost_B}$$
- E.g:
- A country has to decide what to produce based on opportunity cost.

Comparative advantage and opportunity costs

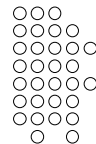

- A nation with the lower opportunity cost in the production of a commodity has a comparative advantage in that commodity.

- E.g:

	US	UK
• Wheat (t/h)	6	1
• Cloth (t/h)	4	2
⇒ US has CA or cost advantage in production of wheat		
⇒ UK has CA or cost advantage in production of cloth		

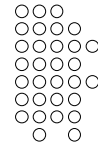

Opportunity Cost of W & C in US and UK		
	US	UK
OC of Wheat	2/3 C	2 C
OC of Cloth	3/2 (w)	1/2 (w)

Pattern of trade

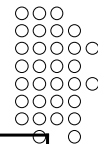

- The US should specialize in producing wheat and export wheat to the UK.
 - The UK should specialize in producing cloth and export cloth to the US.
- => The same as the law of comparative advantage.

Production Possibility Frontier (PPF) under constant cost

- PPF is a curve that shows the alternative combinations of the two commodities that a nation can produce by fully utilizing all of its resources with the best technology available to it.

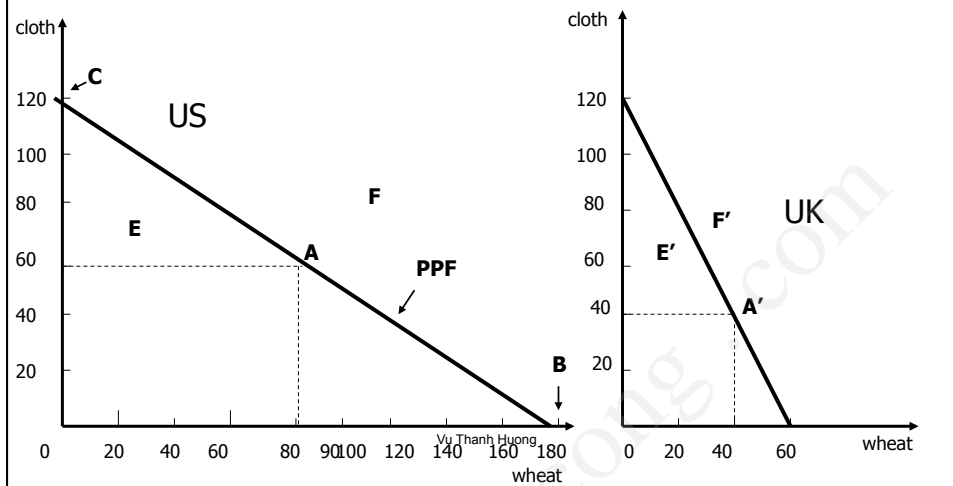

Production Possibility Frontier (PPF) under constant cost (cont.)

Production Possibility Schedules for
Wheat and Cloth in the US and UK

US		UK	
Wheat (million ton/year)	Cloth (million meter/year)	Wheat (million ton/year)	Cloth (million meter/year)
180	0	60	0
150	20	50	20
120	40	40	40
90	60	30	60
60	80	20	80

Production Possibility Frontier (PPF) under constant cost (cont.)

OC and relative commodity prices

- OC_{wheat} in the US = absolute value of slope of PPF = $120/180 = 2/3$ (constant) (marginal rate of transformation)
- OC_{wheat} in the UK = absolute value of slope of PPF = $120/60 = 2$ (constant)
- Assumptions
 - Price = cost of production

$$OC_{wheat} = \frac{Cost_{wheat}}{Cost_{cloth}} \quad OC_{wheat} = \frac{Cost_{wheat}}{Cost_{cloth}} = \frac{Price_{wheat}}{Price_{cloth}} = \frac{P_{wheat}}{P_{cloth}}$$

$$\frac{P_{wheat}}{P_{cloth}} = \frac{2}{3} \quad \frac{P_{wheat}}{P_{cloth}} = 2$$

US

UK

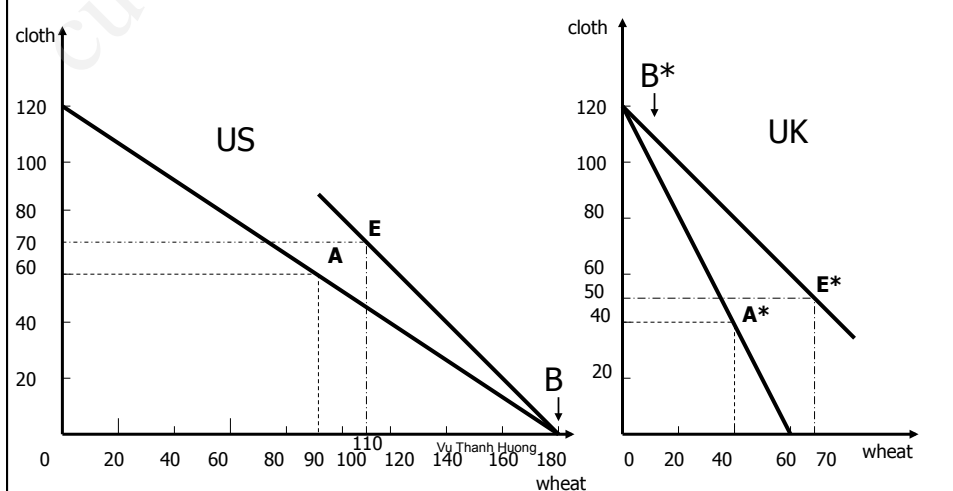

US has CA in wheat
UK has CA in Cloth

OC and relative commodity prices (cont.)

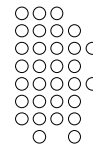

- Under constant costs, P_w/P_c is determined exclusively by production.
- Demand doesn't enter in the determination of relative commodity prices
- The difference in the relative commodity prices between the two nations is the reflection of their CA and provides the basis for mutually beneficial trade

Vu Thanh Huong

The gains from trade

The gains from trade(cont.)

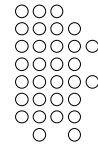

- The gains from trade
 - In the absence of trade: US at point A (90w and 60c); UK at point A' (40w and 40c).
 - With trade:
 - US has CA in w => specializes on production of w and produces at B (180w and 0c);
 - UK specializes on production of c and produces at B' (0w and 120c)
 - US exchanges 70w for 70c and consumes at E (110w; 70c) gains 20w and 10c
 - UK consumes at E' (70w and 50c) gains 30w and 10c

Lecture Review

- Mercantilism
 - Viewpoints
 - Contribution
 - Limitations
- Absolute advantage and Comparative advantage theory
 - 3 questions
 - Limitations
- Opportunity cost theory
 - 3 questions

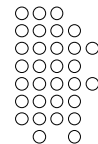

Lecture review - Key terms

- Absolute advantage/Theory of absolute advantage
- Laissez-faire
- Comparative advantage/Theory of comparative advantage
- Labor theory of value
- OC/Formula
- PPF
- Constant OC
- Relative commodity prices
- Complete specialization
- Consumption and production points before and after trade

Vu Thanh Huong

End of lecture 2
Thank you

Vu Thanh Huong
