

CHAPTER 5

Factor Endowments and the Heckscher- Ohlin Theory

1

Lecture Overview

- 1 Assumptions
- 2 Factor Intensity - Factor abundance
- 3 Factor Endowment and H-O theory
- 4 Factor – Price Equalization and Income Distribution

2

Eli Heckscher and Bertin Ohlin

<http://homepage.newschool.edu/het/alphabet.htm>

3

Eli Heckscher

- 1879 - 1952
- Swedish political economist and economic historian.
- Article “The effect of Foreign Trade on the Distribution of Income” (1919).
- Best known for H-O model

4

Bertin Ohlin

- (1899-1979)
- Swedish economist
- 1930s: Contribution for International Economics: H-O model
- Nobel prize in Economic Science in 1977

5

Paul Samuelson

- Paul A. Samuelson (1915 -)
- American economist
- Nobel Prize in Economic Science in 1970.
- Contribution for International Economics: Designer of H-O-S Model (the factor- price equalization theorem)

6

Assumptions of H-O Theory

- Two nations (N1 and N2), two commodities (X and Y), two factors of production (L and K)
- The same technology in production
- X is labor intensive, Y is capital intensive
- Constant returns to scale
- Incomplete specialization in production in both nations
 - What is implications about the shape of PPF?

7

Assumptions of H-O Theory (cont.)

- Equal tastes in both nations
- Perfect competition in both commodities and factor markets
- Perfect factor mobility within each nation but no international factor mobility
- Free trade
- All resources are fully employed in both nations
- International trade in balance

8

FACTOR INTENSITY – FACTOR ABUNDANT

9

Basis for trade

- H-O:
 - comparative advantage
 - Compare with David Ricardo?
- Sources of comparative advantage
 - H-O: factor endowment
 - David Ricardo: productivity

10

Factor intensity

- Two commodities (X and Y) and two factors (L and K)
- Y is capital intensive if **capital-labor ratio (K/L)** used in production of Y is greater than K/L used in production of X

Y is capital intensive product

X is labor intensive product

$$\frac{K}{L}(X) < \frac{K}{L}(Y) \text{ or } \frac{L}{K}(X) > \frac{L}{K}(Y)$$

11

Factor intensity

- E.g: 2K and 2L to produce one unit of Y
1K and 4L to produce one unit of X
 - Identify which product is labor intensive?
 - X: Labor intensive
 - => Y: Capital intensive
- Note: it is not the *absolute* amount of capital and labor used but ratio of K and L determines factor intensity
 - E.g: 2K and 2L to produce one unit of Y
3K and 12L to produce one unit of X
 - Identify which product is capital intensive?
 - Y: Capital intensive
 - X: Labor intensive

12

Factor abundance

- Two ways: physical units and relative factor price.
- In term of physical units:
 - N2 is capital abundant if the ratio of the total amount of capital to the total amount of labor (TK/TL) available in N2 is greater than that in N1

$$\frac{TK}{TL}(N_2) > \frac{TK}{TL}(N_1)$$

- E.g: N1 has 10 million L and 100 million K
N2 has 20 million L and 800 million K
- Identify which country is abundant in K and which country in L?
 - N1: abundant in L
 - N2: abundant in K
- Note: Not the absolute amount of K and L is important.

13

Factor abundance (cont.)

- In term of factor prices:
 - Price of labor time (PL): w
 - Rental price of capital (PK): r
 - N2 is capital abundant if the ratio of the rental price of capital to the price of labor time (PK/PL) is lower in N2 than in N1 (Why lower???)

$$\frac{P_K}{P_L}(N_2) < \frac{P_K}{P_L}(N_1) \quad \frac{r}{w}(N_2) < \frac{r}{w}(N_1)$$

14

Summary

15

Summary (cont.)

$$\frac{P_L}{P_K}(N1) = \frac{w}{r}(N1) < \frac{P_L}{P_K}(N2) = \frac{w}{r}(N2) \rightarrow \text{N1-labor abundant}$$

$$\text{N2-capital abundant} \leftarrow \frac{P_K}{P_L}(N2) = \frac{r}{w}(N2) < \frac{P_K}{P_L}(N1) = \frac{r}{w}(N1)$$

16

Factor abundance – Factor intensity and the Shape of PPF

17

FACTOR ENDOWMENT AND H-O THEORY

18

H-O Theory

H-O theorem deals with the pattern of trade

H-O-S theorem deals with the factor prices

19

H-O Theorem

- H-O Theorem:
 - A Nation
 - Export the commodity whose production requires the intensive use of the nation's relatively abundant and cheap factor
 - Import the commodity whose production requires the intensive use of the nation's relatively scarce and expensive factor.
 - E.g: vietnam and China, the US, Australia

Nation 1: Labor abundant

X: labor intensive

Nation 1 exports X and imports Y

Nation 2: Capital abundant

Y: capital intensive

Nation 2 exports Y, imports X

Illustration of H-O theorem

H-O-S Theorem

- H-O-S theorem (The **Factor-Price** Equalization)
 - International trade will bring about equalization in the relative and absolute return to homogeneous factors across nations.
 - International trade will cause the wages of homogenous labor to be the same in all trading nations.
 - International trade will cause the homogenous capital to be the same in all trading nations.
 - International trade will make w and r the same in both nations.
- => **Both relative and absolute factor prices will be equalized.**

25

Illustration of H-O-S theorem

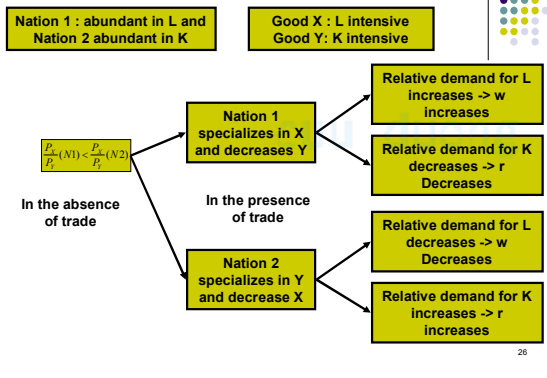

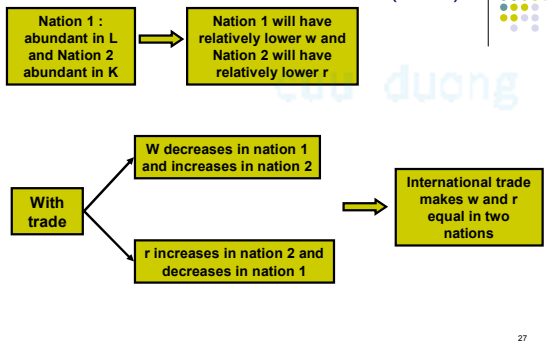

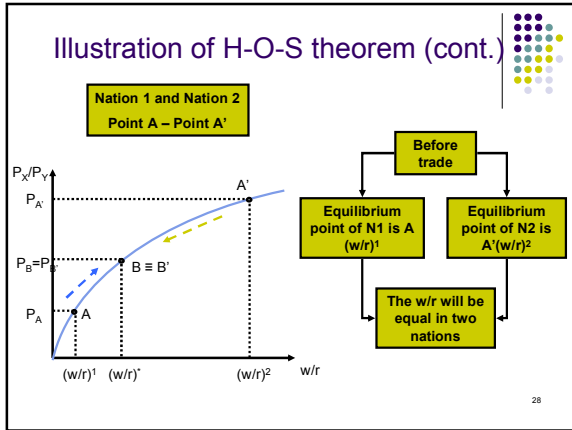

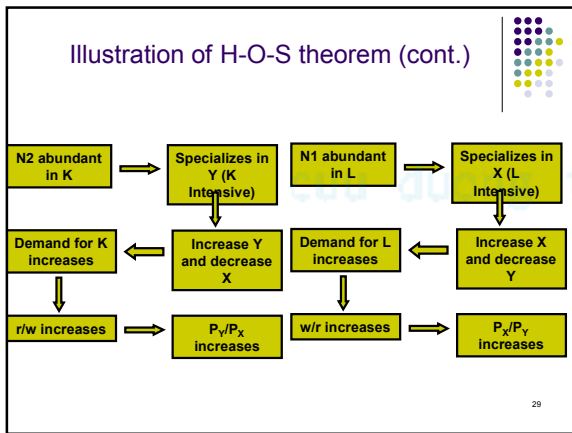

Illustration of H-O-S theorem (cont.)

Income distribution

- In Nation 1, who benefits and who losses?
 - w/r increases
 - Labor: benefits
 - Capital owners: loss
- In Nation 2: who benefits and who losses?
 - w/r decreases
 - Labor: loss
 - Capital owners: benefits

=> In developed countries: labor unions favor trade restriction.

30

The Leontief Paradox

- Tests on US data
 - The US is the most capital-abundant country
 - US exports were less capital-intensive than US imports, **Leontief paradox**.
- Tests on global data
 - Bowen, Leamer, and Sveikauskas tested the Heckscher-Ohlin model on data from 27 countries and confirmed the Leontief paradox on an international level.
- Tests on manufacturing data between low/middle income countries and high income countries.
 - This data lends more support to the theory.

31

The Leontief Paradox (cont.)

TABLE 4-2 Factor Content of U.S. Exports and Imports for 1962

	Imports	Exports
Capital per million dollars	\$2,132,000	\$1,876,000
Labor (person-years) per million dollars	119	131
Capital-labor ratio (dollars per worker)	\$17,916	\$14,321
Average years of education per worker	9.9	10.1
Proportion of engineers and scientists in work force	0.0189	0.0255

Source: Robert Baldwin, "Determinants of the Commodity Structure of U.S. Trade," *American Economic Review* 61 (March 1971), pp. 126-145.

32

The Leontief Paradox (cont.)

- Possible explanations for these findings include
 - that the U.S. has a special advantage in producing new products made with innovative technologies
 - differences in technology
