# **ECE 307 – Techniques for Engineering Decisions**

## **Networks and Flows**

---

**George Gross**

**Department of Electrical and Computer Engineering**

**University of Illinois at Urbana-Champaign**

# NETWORKS AND FLOWS

---

- ❑ A network is a system of lines or channels connecting different points
- ❑ Examples abound in nearly all aspects of life:
  - electrical systems
  - communication networks
  - airline webs
  - local area networks
  - distribution systems

# NETWORKS AND FLOWS

---

- ❑ The network structure is also common to many other systems that at first glance are not necessarily viewed as networks
  - distribution system consisting of manufacturing plants, warehouses and retail outlets
  - matching problems such as work to people, assignments to machines and computer dating

# NETWORKS AND FLOWS

---

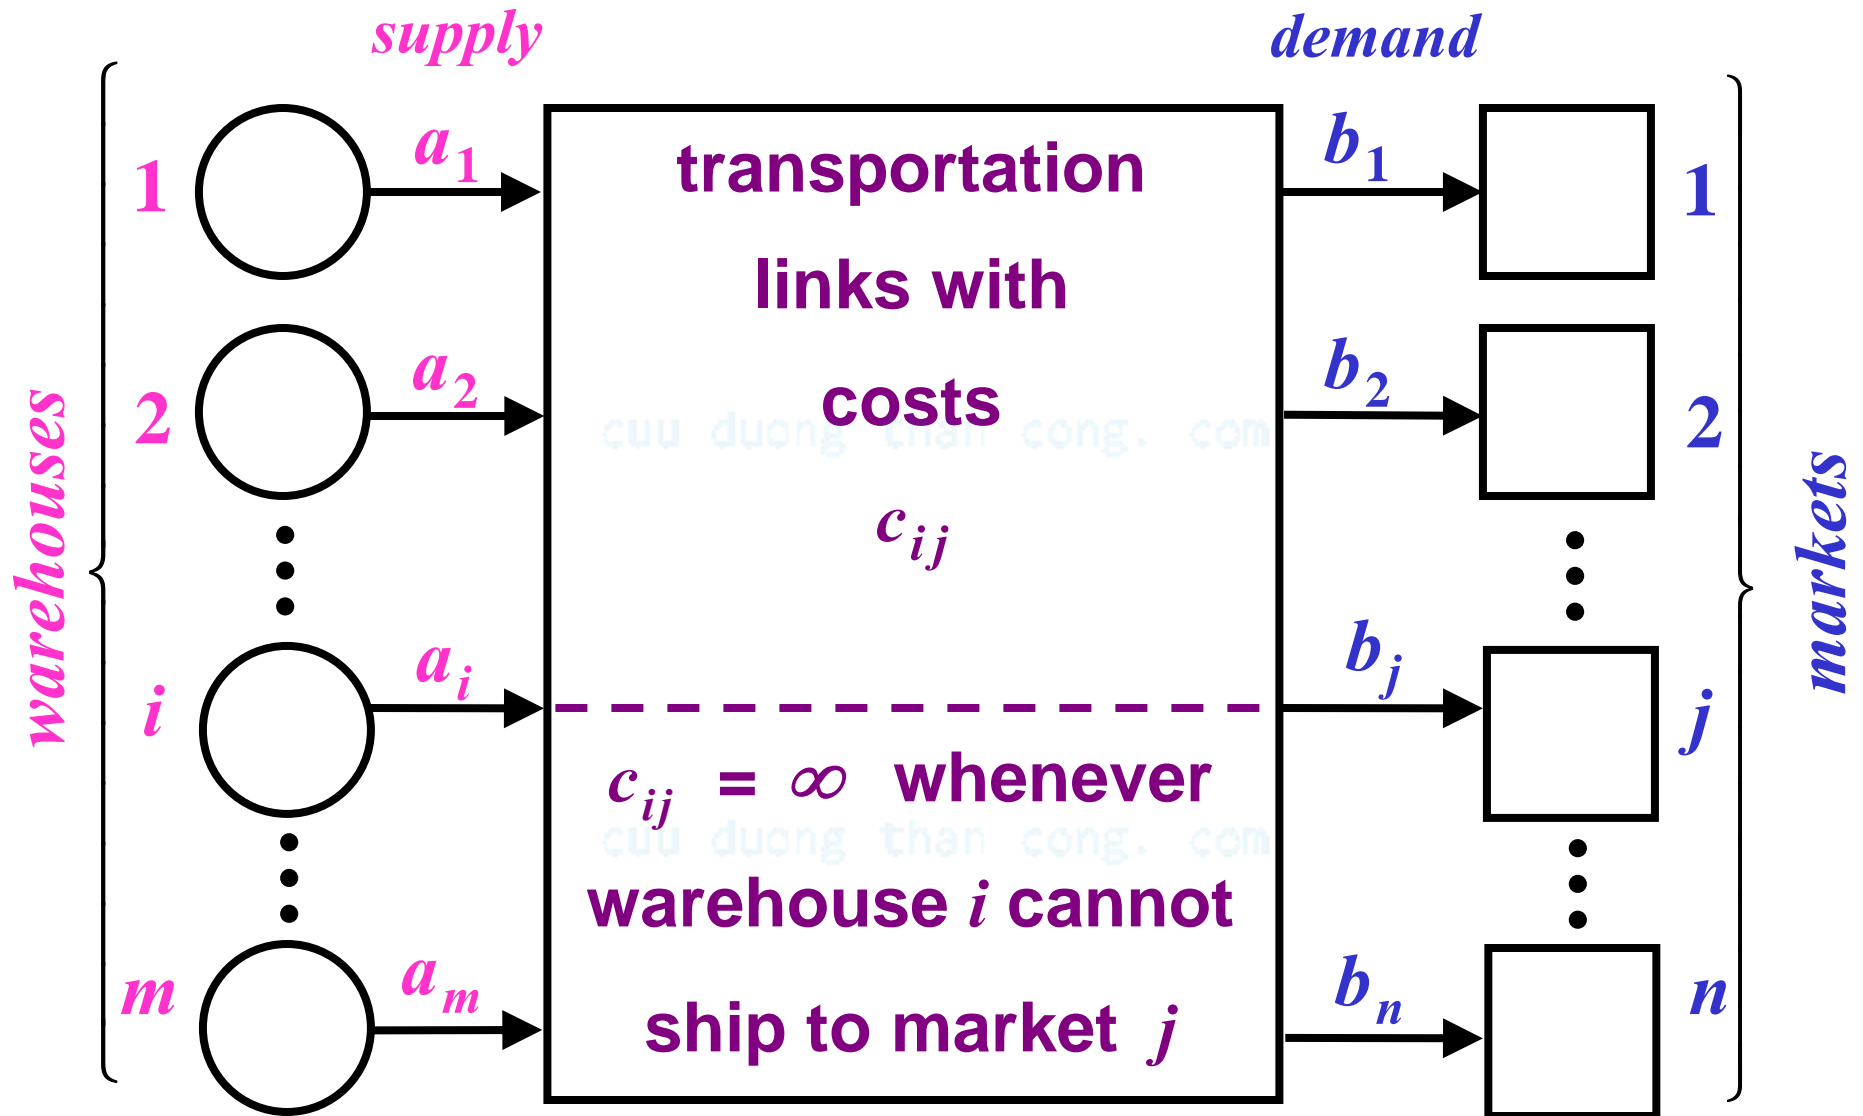

- **river systems with pondage for electricity generation**
  - **mail delivery networks**
  - **project management of multiple tasks in a large undertaking such as construction or a space flight**
- We consider a broad range of network and network flow problems**

# THE TRANSPORTATION PROBLEM

---

- ❑ The basic idea of the transportation problem is illustrated with the problem of distribution of a specified *homogenous* product from several sources to a number of localities *at least cost*
- ❑ We consider a system with  $m$  warehouses,  $n$  markets and links between them with the specified costs of transportation

# THE TRANSPORTATION PROBLEM

# THE TRANSPORTATION PROBLEM

---

- all the supply comes from the  $m$  **warehouses**; we associate the index  $i = 1, 2, \dots, m$  with a **warehouse**  
cuu duong than cong. com
- all the demand is at the  $n$  **markets**; we associate the index  $j = 1, 2, \dots, n$  with a **market**  
cuu duong than cong. com
- shipping costs  $c_{ij}$  for each unit from the **warehouse  $i$**  to the **market  $j$**

# THE TRANSPORTATION PROBLEM

---

□ The transportation problem is to determine the

*optimal shipping schedule* that minimizes shipping

cuu duong than cong. com

costs for the set of  $m$  warehouses to the set of

$n$  markets : the quantities shipped from the

warehouse  $i$  to each market  $j$

# LP FORMULATION OF THE TRANSPORTATION PROBLEM

---

□ The decision variables are

$x_{ij}$  = quantity shipped from *warehouse*  $i$  to *market*  $j$

cuu duong than cong. com

$$i = 1, 2, \dots, m$$

$$j = 1, 2, \dots, n$$

□ The objective function is

$$\min \sum_{i=1}^m \sum_{j=1}^n c_{ij} x_{ij}$$

# LP FORMULATION OF THE TRANSPORTATION PROBLEM

---

□ The constraints are:

$$\sum_{j=1}^n x_{ij} \leq a_i \quad i = 1, 2, \dots, m$$

cuu duong than cong. com

$$\sum_{i=1}^m x_{ij} \geq b_j \quad j = 1, 2, \dots, n$$

cuu duong than cong. com

$$i = 1, 2, \dots, m$$

$$x_{ij} \geq 0$$

$$j = 1, 2, \dots, n$$

# LP FORMULATION OF THE TRANSPORTATION PROBLEM

---

□ Note that feasibility requires

$$\sum_{i=1}^m a_i \geq \sum_{j=1}^n b_j$$

□ When

$$\sum_{i=1}^m a_i = \sum_{j=1}^n b_j$$

every available unit of supply at the  $m$  **ware-**  
**houses** is shipped to meet all the demands of the  
 $n$  **markets**; this problem is known as the *standard*  
*transportation problem*

# STANDARD TRANSPORTATION PROBLEM

---

$$\min \sum_{i=1}^m \sum_{j=1}^n c_{ij} x_{ij}$$

*s.t.*

$$\left. \begin{array}{l} \sum_{j=1}^n x_{ij} = a_i \\ \sum_{i=1}^m x_{ij} = b_j \\ x_{ij} \geq 0 \end{array} \right\} \begin{array}{l} i = 1, \dots, m \\ j = 1, \dots, n \end{array}$$

# TRANSPORTATION PROBLEM EXAMPLE

| <div>market <math>j</math></div> <div>w/h <math>i</math></div> | $M_1$                | $M_2$                | $M_3$                | $M_4$                | <i>supplies</i> |

# STANDARD TRANSPORTATION PROBLEM

---

□ The standard transportation problem has

○  $m n$  variables  $x_{ij}$

○  $m + n$  equality constraints

□ Since

$$\sum_{i=1}^m \sum_{j=1}^n x_{ij} = \sum_{i=1}^m a_i = \sum_{j=1}^n b_j$$

there are at most  $(m + n - 1)$  independent constraints and consequently at most  $(m + n - 1)$  independent variables  $x_{ij}$

# TRANSPORTATION PROBLEM EXAMPLE

| <i>market j</i><br><i>w/h i</i> | $M_1$ | $M_2$ | $M_3$ | $M_4$ | $a_i$ |
|---------------------------------|-------|-------|-------|-------|-------|
| $W_1$                           | 2     | 2     | 2     | 1     | 3     |

| $b_j$                           | 4     | 3     | 4     | 4     |       |

# THE LEAST – COST RULE PROCEDURE

---

- This scheme is used to generate an initial basic feasible solution which has no more than  $(m + n - 1)$  positive valued basic variables
- The key idea of the scheme is to select, at each step, the variable  $x_{ij}$  with the *lowest shipping costs*  $c_{ij}$  as the next basic variable

# APPLICATION OF THE LEAST – COST RULE

---

□  $c_{14}$  is the lowest  $c_{ij}$  and we select  $x_{14}$  as a *basic variable*

□ We choose  $x_{14}$  as large as possible without violating any constraints:

$$\min \{ a_1, b_4 \} = \min \{ 3, 4 \} = 3$$

□ We set  $x_{14} = 3$  and

$$x_{11} = x_{12} = x_{13} = 0$$

□ We delete row 1 from any further consideration since all the supplies from  $W_1$  are exhausted

# APPLICATION OF THE LEAST – COST RULE

| <i>market j</i><br><i>w/h i</i> | $M_1$ | $M_2$ | $M_3$ | $M_4$  | $a_i$ |
|---------------------------------|-------|-------|-------|--------|-------|
| $W_1$                           | 2     | 2     | 2     | 3<br>1 | 3     |
| $W_2$                           | 10    | 8     | 5     | 4      | 7     |
| $W_3$                           | 7     | 6     | 6     | 8      | 5     |
| $b_j$                           | 4     | 3     | 4     | 4      |       |

# APPLICATION OF THE LEAST – COST RULE

---

□ The remaining demand at  $M_4$  is

$$4 - 3 = 1$$

which is the value for the modified demand at  $M_4$

□ We again apply the *criterion selection* for the reduced

tableau:  $c_{24}$  is the lowest-valued  $c_{ij}$  with  $i = 2, j = 4$

and we select  $x_{24}$  as a *basic variable*

# APPLICATION OF THE LEAST – COST RULE

---

- We choose  $x_{24}$  as large as possible without violating any constraints:

$$\min \{ a_2, b_4 \} = \min \{ 7, 1 \} = 1$$

and we set  $x_{24} = 1$  and

$$x_{34} = 0$$

- We delete column 4 from any further consideration since all the demand at  $M_4$  is exhausted

# APPLICATION OF THE LEAST – COST RULE

---

- The remaining supply at  $W_2$  is

$$7 - 1 = 6 ,$$

which is the value for the modified supply at  $W_2$

- We repeat these steps until we find the nonzero

*basic variables* and obtain a *basic feasible solution*

- In the reduced tableau,

# APPLICATION OF THE LEAST – COST RULE

| <i>market j</i><br><i>w/h i</i> | $M_1$ | $M_2$ | $M_3$ | $a_i$ |
|---------------------------------|-------|-------|-------|-------|
| $W_2$                           | 10    | 8     | 4     | 6     |
| $W_3$                           | 7     | 6     | 0     | 5     |
| $b_j$                           | 4     | 3     | 4     |       |

# APPLICATION OF THE LEAST – COST RULE

---

○ pick  $x_{23}$  to enter the basis

○ set

$$x_{23} = \min \{ 6, 4 \} = 4$$

cuu duong than cong. com

and set  $x_{33} = 0$

○ eliminate column 3 and reduce the supply at

$W_2$  to

cuu duong than cong. com

$$6 - 4 = 2$$

□ For the reduced tableau

# APPLICATION OF THE LEAST – COST RULE

| <div> <div>market <math>j</math></div> <div><math>w/h \ i</math></div> </div> | $M_1$ | $M_2$ | $a_i$ |
|---|-------|-------|-------|
| $W_2$   | 10    | 8     | 2     |
| $W_3$   | 7     | 3     | 5     |
| $b_j$   | 4     | 3     |       |

# APPLICATION OF THE LEAST – COST RULE

---

○ pick  $x_{32}$  to enter the basis

○ set

$$x_{32} = \min \{ 3, 5 \} = 3$$

and set  $x_{22} = 0$

○ eliminate column 2 in the reduced tableau

and reduce the supply at  $W_3$  to

$$5 - 3 = 2$$

□ The last reduced tableau is

# APPLICATION OF THE LEAST – COST RULE

| <div> <div>market <math>j</math></div> <div><math>w/h</math> <math>i</math></div> </div> | $M_1$ | $a_i$ |

| $W_3$  | 2     | 2     |
| $b_j$  | 4     |       |

# APPLICATION OF THE LEAST – COST RULE

---

○ pick  $x_{31}$  to enter the basis

○ set

$$x_{31} = \min \{ 2, 5 \} = 2$$

○ reduce the demand at  $M_1$  to

$$4 - 2 = 2$$

○ the value of

$$x_{21} = 2$$

is obtained by default

# INITIAL *BASIC FEASIBLE SOLUTION*

| <i>market j</i><br><i>w/h i</i> | $M_1$ | $M_2$ | $M_3$ | $M_4$ | $a_i$ |
|---------------------------------|-------|-------|-------|-------|-------|
| $W_1$                           | 2     | 2     | 2     | 1     | 3     |
| $W_2$                           | 2     |       | 4     | 1     | 7     |
| $W_3$                           | 2     | 3     |       |       | 5     |
| $b_j$                           | 4     | 3     | 4     | 4     |       |

# APPLICATION OF THE LEAST – COST RULE

---

□ The feasible solution involves only the basic

variables and results in shipment costs of

$$\sum_{i=1}^3 \sum_{j=1}^4 c_{ij} x_{ij} = 1 \cdot 3 + 4 \cdot 1 + 5 \cdot 4 + 6 \cdot 3 + 7 \cdot 2 + 10 \cdot 2$$
$$= 79$$

# THE STANDARD TRANSPORTATION PROBLEM

---

□ The primal problem is

$$\min Z = \sum_{i=1}^m \sum_{j=1}^n c_{ij} x_{ij}$$

*s.t.*

$$u_i \quad \Leftrightarrow \quad \sum_{j=1}^n x_{ij} = a_i$$

$$i = 1, \dots, m$$

$$v_j \quad \Leftrightarrow \quad \sum_{i=1}^m x_{ij} = b_j$$

$$j = 1, \dots, n$$

$$x_{ij} \geq 0$$

(*P*)

# THE STANDARD TRANSPORTATION PROBLEM

---

□ The dual problem is

$$\max W = \sum_{i=1}^m a_i u_i + \sum_{j=1}^n b_j v_j$$

*s.t.*

$$x_{ij} \leftrightarrow u_i + v_j \leq c_{ij} \quad i = 1, \dots, m$$

$$j = 1, \dots, n$$

$u_i, v_j$  are unrestricted in sign

(D)

# THE STANDARD TRANSPORTATION PROBLEM

---

□ The *complementary slackness conditions* for  $(D)$  are

$$x_{ij}^* [u_i^* + v_j^* - c_{ij}^*] = 0$$

$i = 1, \dots, m$

*cuu duong than cong.*

$j = 1, \dots, n$

□ Due to the equalities in  $(P)$ , the other *complementary slackness conditions* fail to provide any additional useful information

# THE TRANSPORTATION PROBLEM

---

- The *complementary slackness conditions* obtain

$$x_{ij}^* > 0 \Rightarrow u_i^* + v_j^* = c_{ij}$$

$$u_i^* + v_j^* < c_{ij} \Rightarrow x_{ij}^* = 0$$

- We make use of the duality characteristics to

develop the *u – v method* for solving the *standard*

*transportation problem*

# THE $u - v$ METHOD

---

- The  $u - v$  method starts with a *basic feasible solution* for the primal problem, obtains the corresponding dual variables (as if the solution were optimal) and uses the duals to determine the *adjacent basic feasible solution*; the process continues until the optimality condition is satisfied

# THE $u - v$ METHOD

---

□ For a *basic feasible solution*, we find the dual variable  $u_i$  and  $v_j$  using the *complementary slackness conditions*

$$u_i + v_j = c_{ij} \quad \forall \text{ basic } x_{ij}$$

with  $u_i$  and  $v_j$  being unrestricted in sign

# THE $u - v$ METHOD

---

- We compute using

$$\tilde{c}_{ij} = c_{ij} - (u_i + v_j) \quad \forall \text{ nonbasic } x_{ij}$$

- the step is the analogue of computing  $\underline{\tilde{c}}^T$  in the simplex tableau approach (relative cost improvement vector)
- The *complementary-slackness*-based optimality test is performed :

$$\text{if } \tilde{c}_{ij} \geq 0 \quad \forall \text{ nonbasic } x_{ij} \left[ x_{ij} = 0 \right] ,$$

then the *basic feasible solution* is *optimal*

# THE $u - v$ METHOD

---

□ Otherwise, some nonbasic variable  $x_{\bar{p}\bar{q}} \ni$

$$\tilde{c}_{\bar{p}\bar{q}} = c_{\bar{p}\bar{q}} - (u_{\bar{p}} + v_{\bar{q}}) < 0$$

exists and we determine

$$\tilde{c}_{pq} = \min_{\substack{\bar{p}\bar{q} \ni x_{\bar{p}\bar{q}} \\ \text{is nonbasic}}} \left\{ \tilde{c}_{\bar{p}\bar{q}} \right\}$$

□ We, then, select  $x_{pq}$  to become a *basic variable* and repeat the process for this new *basic feasible solution*

# STANDARD TRANSPORTATION PROBLEM EXAMPLE

---

□ We apply the  $u - v$  scheme to the example

previously discussed

cuu duong than cong. com

□ The basic step from the dual formulation is to

require

cuu duong than cong. com

$$u_i + v_j = c_{ij}$$

$$\forall \text{ basic } x_{ij}$$

# STANDARD TRANSPORTATION PROBLEM EXAMPLE

---

- We start with the *basic feasible solution* and apply the *complementary slackness conditions*

$$u_1 + v_4 = 1 = c_{14}$$

$$u_2 + v_4 = 4 = c_{24}$$

$$u_2 + v_3 = 5 = c_{23}$$

$$u_3 + v_2 = 6 = c_{32}$$

$$u_3 + v_1 = 7 = c_{31}$$

$$u_2 + v_1 = 10 = c_{21}$$

- We have 6 equations in 7 unknowns and so there is an infinite number of solutions

# STANDARD TRANSPORTATION PROBLEM EXAMPLE

---

□ Arbitrarily, we set

$$v_4 = 0$$

and solve the equations above to obtain

$$u_1 = 1$$

$$u_2 = 4$$

$$v_3 = 1$$

$$v_1 = 6$$

$$u_3 = 1$$

$$v_2 = 5$$

# STANDARD TRANSPORTATION PROBLEM EXAMPLE

---

□ The  $\tilde{c}_{ij}$  for the *nonbasic variables* are

$$x_{11} : \tilde{c}_{11} = c_{11} - (u_1 + v_1) = 2 - (1 + 6) = -5$$

$$x_{12} : \tilde{c}_{12} = c_{12} - (u_1 + v_2) = 2 - (1 + 5) = -4$$

$$x_{13} : \tilde{c}_{13} = c_{13} - (u_1 + v_3) = 2 - (1 + 1) = 0$$

$$x_{34} : \tilde{c}_{34} = c_{34} - (u_3 + v_4) = 8 - (1 + 0) = 7$$

$$x_{33} : \tilde{c}_{33} = c_{33} - (u_3 + v_3) = 6 - (1 + 1) = 4$$

# STANDARD TRANSPORTATION PROBLEM EXAMPLE

---

□ We determine

$$\tilde{c}_{pq} = \min_{\substack{\bar{p}\bar{q} \ni x_{\bar{p}\bar{q}} \\ \text{is nonbasic}}} = \tilde{c}_{11} = -5$$

and consequently the *nonbasic variable*  $x_{11}$  is

introduced into the *basis*

□ We determine the maximal value of  $x_{11}$  by

setting  $x_{11} = \theta$  and make use of the tableau

# STANDARD TRANSPORTATION EXAMPLE

| <div>market <math>j</math></div> <div>w/h <math>i</math></div> | $M_1$        | $M_2$ | $M_3$ | $M_4$        | $a_i$ |
|--|--------------|-------|-------|--------------|-------|
| $W_1$  | $\theta$     |       |       | $3 - \theta$ | 3     |
| $W_2$  | $2 - \theta$ |       | 4     | $1 + \theta$ | 7     |
| $W_3$  | 2            | 3     |       |              | 5     |
| $b_j$  | 4            | 3     | 4     | 4            |       |

# STANDARD TRANSPORTATION EXAMPLE

---

□ Therefore,

$$\max \theta = \min \{ 2, 3 \} = 2$$

□ Consequently,  $x_{21} = 0$  and leaves the basis

□ We obtain the *basic feasible solution*

$$x_{14} = 1, x_{11} = 2, x_{31} = 2, x_{32} = 3, x_{23} = 4, x_{24} = 3$$

and repeat to solve the  $u - v$  problem for this

new *basic feasible solution*

# STANDARD TRANSPORTATION EXAMPLE

---

□ We evaluate  $\tilde{c}_{ij}$  for each nonbasic variable;

$\tilde{c}_{ij} \geq 0$  and so we have an optimal solution with

shipping 3 from  $W_1$  to  $M_1$  with costs 6

shipping 1 from  $W_3$  to  $M_1$  with costs 7

shipping 3 from  $W_3$  to  $M_2$  with costs 18

shipping 1 from  $W_3$  to  $M_3$  with costs 6

shipping 3 from  $W_2$  to  $M_3$  with costs 15

shipping 4 from  $W_2$  to  $M_4$  with costs 16

and resulting in the least total costs of 68

# ELECTRICITY DISTRIBUTION EXAMPLE

---

- ☐ We consider in an electric utility system in which  
  
3 power plants are used to supply the demand of  
  
4 cities
- ☐ The supplies available from the 3 plants are given
- ☐ The demands of the 4 cities are specified
- ☐ The costs of supplying each  $10^6 \text{ kWh}$  are given

# ELECTRICITY COSTS

| <div> <div>to</div> <div>from</div> </div> |   | city |    |    |    | supplies<br>( $10^6$ kWh) |
|--|---|------|----|----|----|---------------------------|
|  |   | 1    | 2  | 3  | 4  |                           |
| plant                                      | 1 | 8    | 6  | 10 | 9  | 35                        |

# ELECTRICITY ALLOCATION EXAMPLE

---

□ We note that

$$\sum_{i=1}^3 a_i = \sum_{j=1}^4 b_j$$

cuu duong than cong. com

and so we have a balanced transportation  
problem

cuu duong than cong. com

□ We find a basic feasible solution using the least-  
cost rule

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

| <div> <div>to</div> <div>from</div> </div> |   | city |    |    |    | supplies<br>( $10^6$ kWh) |
|--|---|------|----|----|----|---------------------------|
|  |   | 1    | 2  | 3  | 4  |                           |
| plant                                      | 1 | 8    | 6  | 10 | 0  | 35                        |
|  | 2 | 9    | 12 | 13 | 0  | 50                        |
|  | 3 | 14   | 9  | 16 | 30 | 10                        |
| demands<br>( $10^6$ kWh)                   |   | 45   | 20 | 30 | 30 | 125                       |

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

---

□ And we set

$$x_{34} = 30$$

$$x_{14} = 0$$

$$x_{24} = 0$$

□ We compute the supply left at plant 3 and remove column 4 from further consideration

□ We continue with the reduced system

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

| <div>to</div> <div>from</div> |   | city |    |    | supplies<br>( $10^6$ kWh) |
|-------------------------------|---|------|----|----|---------------------------|
|                               |   | 1    | 2  | 3  |                           |
| plant                         | 1 | 8    | 20 | 10 | 15                        |
|                               | 2 | 9    | 0  | 13 | 50                        |
|                               | 3 | 14   | 0  | 16 | 10                        |
| demands<br>( $10^6$ kWh)      |   | 45   | 20 | 30 |                           |

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

---

and so we set

$$x_{12} = 20$$

$$x_{22} = 0$$

$$x_{32} = 0$$

- We recompute the supply left at plant 1 and remove column 2 from further consideration
- The new reduced system obtains

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

| <div> <div>to</div> <div>from</div> </div> |   | city    |         | supplies<br>( $10^6$ kWh) |
|--|---|---------|---------|---------------------------|
|  |   | 1       | 3       |                           |
| plant                                      | 1 | 15<br>8 | 0<br>10 | 15                        |
|  | 2 | 9       | 13      | 50                        |
|  | 3 | 14      | 16      | 10                        |
| demands<br>( $10^6$ kWh)                   |   | 30      | 30      |                           |

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

---

and therefore we set

$$x_{11} = 15$$

$$x_{13} = 0$$

and remove row 1 from further consideration

since the supply at plant 1 is exhausted

□ The operation is repeated for the further reduced system

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

| <div> <div>to</div> <div>from</div> </div> |   | city    |    | supplies<br>( $10^6$ kWh) |
|--|---|---------|----|---------------------------|
|  |   | 1       | 3  |                           |
| plant                                      | 2 | 30<br>9 | 13 | 20                        |
|  | 3 | 0<br>14 | 16 | 10                        |
| demands<br>( $10^6$ kWh)                   |   | 30      | 30 |                           |

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

---

and therefore we set

$$x_{21} = 30$$

$$x_{31} = 0$$

and remove column 1 from further consideration

since all the demand in city 1 is satisfied

□ We are finally left with

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

| <div> <div>to</div> <div>city</div> </div> |   | <div> <div>supplies</div> <div>(10<sup>6</sup> kWh)</div> </div> |
|--|---|--|
|  |   |  |
| from                                       | 3 |  |
| plant                                      | 2 | 20   |
|  | 3 | 10   |
| demands (10 <sup>6</sup> kWh)              |   | 30   |

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

---

which allows us to set

$$x_{23} = 20$$

$$x_{33} = 10$$

□ The basic feasible solution has the costs

$$Z = 30 \cdot 5 + 20 \cdot 6 + 15 \cdot 8 + 30 \cdot 9 + 20 \cdot 13 + 10 \cdot 16 = 1080$$

□ We improve this solution by using the  $u - v$  scheme

□ The first tableau corresponding to the initial basic feasible solution is:

# ELECTRICITY ALLOCATION EXAMPLE: SOLUTION

| <div> <div>to</div> <div>from</div> </div> |   | city                       |                            |                             |                            | supplies<br>( $10^6$ kWh) |
|--|---|----------------------------|----------------------------|-----------------------------|----------------------------|---------------------------|
|  |   | 1                          | 2                          | 3                           | 4                          |                           |
| plant                                      | 1 | <div>15</div> <div>8</div> | <div>20</div> <div>6</div> |                             |                            | 35                        |
|  | 2 | <div>30</div> <div>9</div> |                            | <div>20</div> <div>13</div> |                            | 50                        |
|  | 3 |                            |                            | <div>10</div> <div>16</div> | <div>30</div> <div>5</div> | 40                        |
| demands<br>( $10^6$ kWh)                   |   | 45                         | 20                         | 30                          | 30                         |                           |

# STANDARD TRANSPORTATION EXAMPLE

□ We compute, the possible improvements at each nonbasic variable:

$$\tilde{c}_{31} = c_{31} - (u_3 + v_1) = 14 - (4 + 8) = 2$$

$$\tilde{c}_{22} = c_{22} - (u_2 + v_2) = 12 - (1 + 6) = 5$$

$$\tilde{c}_{32} = c_{32} - (u_3 + v_2) = 9 - (4 + 6) = -1$$

$$\tilde{c}_{13} = c_{13} - (u_1 + v_3) = 10 - (0 + 12) = -2$$

$$\tilde{c}_{14} = c_{14} - (u_1 + v_4) = 9 - (0 + 1) = 8$$

$$\tilde{c}_{24} = c_{24} - (u_2 + v_4) = 7 - (1 + 1) = 5$$

improvement possible

better possibility

# STANDARD TRANSPORTATION EXAMPLE

---

□ We bring  $x_{13}$  into the basis and determine the value of  $\theta$  using the tableau structure

□ From the tableau we conclude that

$$\theta = \min \{ 15, 20 \} = 15$$

and therefore  $x_{11}$  leaves the basis and obtain the

adjacent basic possible solution given in the table

# STANDARD TRANSPORTATION EXAMPLE

| <i>plants</i> \ <i>cities</i> | 1             | 2  | 3             | 4  | $a_i$ |
|-------------------------------|---------------|----|---------------|----|-------|
| 1                             | $15 - \theta$ | 20 | $\theta$      |    | 35    |
| 2                             | $30 + \theta$ |    | $20 - \theta$ |    | 50    |
| 3                             |               |    | 10            | 30 | 40    |
| $b_j$                         | 45            | 20 | 30            | 30 |       |

# STANDARD TRANSPORTATION EXAMPLE

---

□ The adjacent basic feasible solution is

$$x_{21} = 45, \quad x_{12} = 20, \quad x_{13} = 15, \quad x_{23} = 5, \quad x_{33} = 10, \quad x_{34} = 30$$

and the new value of  $Z$  is

$$\begin{aligned} Z &= 20 \cdot 6 + 15 \cdot 10 + 45 \cdot 9 + 5 \cdot 13 + 10 \cdot 16 + 30 \cdot 5 \\ &= 1050 < 1080 \end{aligned}$$

□ We again pursue a  $u - v$  improvement strategy  
by starting with the tableau

# STANDARD TRANSPORTATION EXAMPLE

| <i>plants</i> \ <i>cities</i> | $v_1 = 6$                  | $v_2 = 6$                  | $v_3 = 10$                  | $v_4 = -1$                 | <i>supplies</i> |
|-------------------------------|----------------------------|----------------------------|-----------------------------|----------------------------|-----------------|
| $u_1 = 0$                     |                            | <div>20</div> <div>6</div> | <div>15</div> <div>10</div> |                            | 35              |
| $u_2 = 3$                     | <div>45</div> <div>9</div> |                            | <div>5</div> <div>13</div>  |                            | 50              |
| $u_3 = 6$                     |                            |                            | <div>10</div> <div>16</div> | <div>30</div> <div>5</div> | 40              |
| <i>demands</i>                | 45                         | 20                         | 30                          | 30                         |                 |

# STANDARD TRANSPORTATION EXAMPLE

- The complementary slackness conditions obtain the possible improvements

$$\tilde{c}_{11} = c_{11} - (u_1 + v_1) = 8 - (0 + 6) = 2$$

$$\tilde{c}_{31} = c_{31} - (u_3 + v_1) = 14 - (6 + 6) = 2$$

$$\tilde{c}_{22} = c_{22} - (u_2 + v_2) = 12 - (3 + 6) = 3$$

$$\tilde{c}_{32} = c_{32} - (u_3 + v_2) = 9 - (6 + 6) = -3$$

$$\tilde{c}_{14} = c_{14} - (u_1 + v_4) = 9 - (0 - 1) = 10$$

$$\tilde{c}_{24} = c_{24} - (u_2 + v_4) = 7 - (3 - 1) = 5$$

only possible improvement

- We bring  $x_{32}$  into the basis and determine its value  $\theta$  using

# STANDARD TRANSPORTATION EXAMPLE

| <i>plants</i><br><i>cities</i> | 1  | 2             | 3             | 4  | $a_i$ |
|--------------------------------|----|---------------|---------------|----|-------|
| 1                              |    | $20 - \theta$ | $15 + \theta$ |    | 35    |
| 2                              | 45 |               | 5             |    | 50    |
| 3                              |    | $\theta$      | $10 - \theta$ | 30 | 40    |
| $b_j$                          | 45 | 20            | 30            | 30 |       |

# STANDARD TRANSPORTATION EXAMPLE

---

and so

$$\theta = \min \{ 10, 20 \} = 10$$

□ The adjacent basic feasible solution is, then,

$$x_{21} = 45 \quad x_{12} = 10 \quad x_{32} = 10$$

$$x_{13} = 25 \quad x_{23} = 5 \quad x_{34} = 30$$

and the value of  $Z$  becomes

$$Z = 45 \cdot 9 + 10 \cdot 6 + 10 \cdot 9 + 25 \cdot 10 + 5 \cdot 13 + 30 \cdot 5 = 1,020$$

□ You are asked to prove, using complementary slackness conditions, that this is the optimum

# NONSTANDARD TRANSPORTATION PROBLEM

---

- ☐ The nonstandard transportation problem arises when supply and demand are unbalanced: either supply exceeds demand or vice versa
- ☐ We solve by transforming the nonstandard problem into a standard one
- ☐ The approach is to create a fictitious entity and thereby restore the problem to balanced status

# NONSTANDARD TRANSPORTATION PROBLEM

---

□ For the case

$$\underbrace{\sum_{i=1}^m a_i}_{\text{supply}} > \underbrace{\sum_{j=1}^n b_j}_{\text{demand}}$$

we create the fictitious market  $M_{n+1}$  to absorb all the excess supply  $\left( \sum_{i=1}^m a_i - \sum_{j=1}^n b_j \right)$ ; we set  $c_{i, n+1} = 0$ ,

$\forall i = 1, 2, \dots, m$  since  $M_{n+1}$  does not exist in reality

The problem is then in standard form with  $j = 1, \dots, n+1$ , an augmented number of markets

# NONSTANDARD TRANSPORTATION PROBLEM

---

□ For the case

$$\underbrace{\sum_{j=1}^n b_j}_{\text{demand}} > \underbrace{\sum_{i=1}^m a_i}_{\text{supply}}$$

the problem is *not*, in effect, *feasible* since all the demands cannot be met and therefore the least-cost shipping schedule is that which will supply as much as possible of the demands of the markets

# NONSTANDARD TRANSPORTATION PROBLEM

---

□ For the overdemand case, we introduce the fictitious warehouse  $W_{m+1}$  to supply the shortage;

$\left[ \sum_{j=1}^n b_j - \sum_{i=1}^m a_i \right]$  we set  $c_{m+1,j} = 0$

for  $j = 1, 2, \dots, n$  and the problem is in standard

form with  $i = 1, \dots, m + 1$  (augmented number of warehouses)

# NONSTANDARD TRANSPORTATION PROBLEM

---

- Note that the variable  $x_{m+1,j}$  is the *shortage* at market  $j$  and is the shortfall in the demand  $b_j$  experienced by the market  $M_j$  due to inadequate supplies
- For each market  $j$ ,  $x_{m+1,j}$  is a measure of the *infeasibility* of the problem

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

- This problem is concerned with the schedule of 2 plants *A* and *B* in the purchase of the raw supplies from 3 growers

| <i>grower</i>  | <i>availability (ton)</i> | <i>price ( \$ / ton )</i> |
|----------------|---------------------------|---------------------------|
| <i>Smith</i>   | 200                       | 10                        |
| <i>Jones</i>   | 300                       | 9                         |
| <i>Richard</i> | 400                       | 8                         |

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

and shipping costs in  $\$/ton$  given by

| <i>from \ to</i> | <i>plant</i> |          |
|------------------|--------------|----------|
|                  | <i>A</i>     | <i>B</i> |
| <i>Smith</i>     | 2            | 2.5      |
| <i>Jones</i>     | 1            | 1.5      |
| <i>Richard</i>   | 5            | 3        |

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

- The plants' labor costs and capacity limits are

| <i>plant</i>                              | <i>A</i> | <i>B</i> |
|---|----------|----------|
| <i>capacity</i><br>( <i>ton</i> )         | 450      | 550      |
| <i>labor costs</i><br>( \$ / <i>ton</i> ) | 25       | 20       |

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

- ❑ The selling price for canned goods is  $50 \$ / ton$  and the company can sell all it produces
- ❑ The problem is to determine the *maximum* profit schedule
- ❑ Note that this is an unbalanced problem since
$$\begin{aligned} supply &= 200 + 300 + 400 = 900 \text{ tons} \\ demand &= 450 + 550 = 1000 \text{ tons} > 900 \text{ tons} \end{aligned}$$
- ❑ Clearly, the decision variables are the amounts purchased from each grower and shipped to each plant

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

□ The objectives is formulated as

$$\begin{aligned}
 \max Z = & \left[ \underbrace{50 - 25 - 10 - 2}_{13} \right] x_{SA} + \left[ \underbrace{50 - 25 - 9 - 1}_{15} \right] x_{JA} \\
 & + \left[ \underbrace{50 - 25 - 8 - 5}_{12} \right] x_{RA} + \left[ \underbrace{50 - 20 - 10 - 2.5}_{17.5} \right] x_{SB} \\
 & + \left[ \underbrace{50 - 20 - 9 - 1.5}_{19.5} \right] x_{JB} + \left[ \underbrace{50 - 20 - 8 - 3}_{19} \right] x_{RB}
 \end{aligned}$$

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

□ The supply constraints are

$$x_{SA} + x_{SB} \leq 200$$

$$x_{JA} + x_{JB} \leq 300$$

$$x_{RA} + x_{RB} \leq 400$$

□ The demand constraints are

$$x_{SA} + x_{JA} + x_{RA} \leq 450$$

$$x_{SB} + x_{JB} + x_{RB} \leq 550$$

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

- ❑ Clearly, all decision variables are nonnegative
- ❑ The unbalanced nature of the problem requires the introduction of a *fictitious* grower  $F$  with the supply 100 corresponding to the supply shortage; in this way the *nonstandard* problem becomes *standard*
- ❑ We set up the standard transportation problem

# EXAMPLE: CANNING OPERATIONS SCHEDULING

| <i>plant j</i><br><i>grower i</i> | <i>A</i> | <i>B</i> | <i>supply</i> |
|-----------------------------------|----------|----------|---------------|
| <i>S</i>                          | 13       | 17.5     | 200           |
| <i>J</i>                          | 15       | 19.5     | 300           |
| <i>R</i>                          | 12       | 19       | 400           |
| <i>F</i>                          | 0        | 0        | 100           |
| <i>demand</i>                     | 450      | 550      |               |

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

- ❑ Please note that the objective is a *maximization* rather than a *minimization*
- ❑ We therefore recast the mechanics of the  $u$ - $v$  scheme for the *maximization* problem
- ❑ As a homework exercise, show that the duality complementary slackness conditions allow us to change the  $u - v$  algorithm in the following way:

# EXAMPLE: CANNING OPERATIONS SCHEDULING

---

- the selection of the nonbasic variable  $x_{ij}$  to enter the basis is from those  $x_{ij}$  where the corresponding

$$c_{ij} > u_i + v_j$$

and we evaluate and focus on all  $\tilde{c}_{ij} > 0$  so that  $x_{ij}$  is a candidate to enter the basis

- we pick  $x_{pq}$

$$\tilde{c}_{pq} = \max_{\substack{\bar{p}\bar{q} \ni x_{\bar{p}\bar{q}} \\ \text{is nonbasic}}} \left\{ \tilde{c}_{\bar{p}\bar{q}} \right\}$$

*is nonbasic*

# EXAMPLE SOLUTION

| <i>plant j</i><br><i>grower i</i> | <i>A</i>  | <i>B</i>   | <i>supply</i> |
|-----------------------------------|-----------|------------|---------------|
| <i>S</i>                          | 200<br>13 | 0          | 200           |
| <i>J</i>                          | 250<br>15 | 50<br>19.5 | 300           |
| <i>R</i>                          | 0         | 400<br>19  | 400           |
| <i>F</i>                          | 0<br>0    | 100<br>0   | 100           |
| <i>demand</i>                     | 450       | 550        |               |

# EXAMPLE SOLUTION

---

□ We construct the  $u - v$  relations for this solution

$$u_1 + v_1 = 13$$

$$u_2 + v_2 = 19.5$$

$$u_2 + v_1 = 15$$

$$u_3 + v_2 = 19$$

$$u_4 + v_2 = 0$$

□ We arbitrarily set  $u_1 = 0$  and compute

$$v_1 = 13, u_2 = 2, v_2 = 17.5, u_3 = 1.5, u_4 = -17.5$$

# EXAMPLE SOLUTION

---

- We evaluate the  $\tilde{c}_{ij}$  corresponding to the nonbasic variables

$$\tilde{c}_{31} = c_{31} - (u_3 + v_1) = 12 - (1.5 + 13) = -2.5$$

$$\tilde{c}_{41} = c_{41} - (u_4 + v_1) = 0 - (-17.5 + 13) = 4.5$$

$$\tilde{c}_{12} = c_{12} - (u_1 + v_2) = 17.5 - (0 + 17.5) = 0$$

**single possible improvement**

- Thus,  $x_{41}$  enters the basis and we determine  $\theta$

# EXAMPLE SOLUTION

| <i>plant j</i><br><i>grower i</i> | <i>A</i>             | <i>B</i>              | <i>supply</i> |
|-----------------------------------|----------------------|-----------------------|---------------|
| <i>S</i>                          | 200<br>13            |                       | 200           |
| <i>J</i>                          | $250 - \theta$<br>15 | $50 + \theta$<br>19.5 | 300           |
| <i>R</i>                          |                      | 400<br>19             | 400           |
| <i>F</i>                          | $\theta$<br>0        | $100 - \theta$<br>0   | 100           |
| <i>demand</i>                     | 450                  | 550                   |               |

# EXAMPLE SOLUTION

---

□ It follows that

$$\theta = \min \{ 250, 100 \} = 100$$

cuu duong than cong. com

and so the adjacent basic feasible solution is

$$x_{11} = 200, x_{21} = 150, x_{41} = 100, x_{22} = 150, x_{32} = 400$$

□ We repeat the  $u - v$  procedure to obtain

# EXAMPLE SOLUTION

---

$$u_1 + v_1 = 13$$

$$u_2 + v_2 = 19.5$$

$$u_2 + v_1 = 15$$

$$u_3 + v_2 = 19$$

cuu duong than cong. com

$$u_4 + v_1 = 0$$

□ We solve by arbitrarily setting  $u_1 = 0$  and obtain

cuu duong than cong. com

$$v_1 = 13, u_2 = 2, v_2 = 17.5, u_3 = 1.5, u_4 = -13$$

# EXAMPLE SOLUTION

---

□ We compute the  $\tilde{c}_{ij}$  for the nonbasic variables

$$\tilde{c}_{12} = 17.5 - (0 + 17.5) = 0$$

cuu duong than cong. com

$$\tilde{c}_{31} = 12 - (1.5 + 13) = -2.5$$

cuu duong than cong. com

$$\tilde{c}_{42} = 0 - (-13 + 17.5) = -4.5$$

# EXAMPLE SOLUTION

---

- Since each  $\tilde{c}_{ij}$  is  $\leq 0$  no more improvement in the maximization is possible and so the maximum profits are

$$Z = (200)13 + (150)15 + (100)0 + (150)19.5 + (400)19$$
$$= 15,375 \$$$

# SCHEDULING PROBLEM AS A STANDARD TRANSPORTATION PROBLEM

---

- ❑ The problem is concerned with the weekly production scheduling over a 4 – week period
- production costs from each item

|                        |       |
|------------------------|-------|
| <i>first two weeks</i> | \$ 10 |
| <i>last two weeks</i>  | \$ 15 |

- demands that need to be met are

|               |     |     |     |     |
|---------------|-----|-----|-----|-----|
| <i>week</i>   | 1   | 2   | 3   | 4   |
| <i>demand</i> | 300 | 700 | 900 | 800 |

# SCHEDULING PROBLEM AS A STANDARD TRANSPORTATION PROBLEM

---

- weekly plant capacity is 700
- overtime is possible for weeks 2 and 3 with
  - the production of additional 200 *units*
  - additional cost per unit of \$ 5
- \$ 3 for weekly storage of excess production
- the objective is to *minimize* the *total costs* for the 4-week schedule

□ The decision variables are

$x_{ij}$  = production in week  $i$  for use in week  $j$  market

# SCHEDULING PROBLEM AS A STANDARD TRANSPORTATION PROBLEM

| demand \ production |        | 1   | 2   | 3   | 4   | F   | supply |
|---------------------|--------|-----|-----|-----|-----|-----|--------|
| 1                   |        | 10  | 13  | 16  | 19  | 0   | 700    |
|                     | normal | M   | 10  | 13  | 16  | 0   | 700    |
| 2                   | o/t    | M   | 15  | 18  |     | 0   | 200    |
|                     | normal | M   | M   | 15  | 18  | 0   | 700    |
| 3                   | o/t    | M   |     |     |     | 0   | 200    |
|                     |        |     |     |     |     | 0   | 700    |
| 4                   |        | M   | M   | M   | 15  | 0   |        |
| demand              |        | 300 | 700 | 900 | 800 | 500 |        |

*M is a very large number*

*3,200*

*2,700*

*3,200 - 2,700*

# ASSIGNMENT PROBLEM

---

□ We are given

$n$  machines  $M_1, M_2, \dots, M_n \leftrightarrow i$

$n$  jobs  $J_1, J_2, \dots, J_n \leftrightarrow j$

$c_{ij}$  = cost of doing job  $j$  on machine  $i$

$c_{ij} = \hat{M}$  if job  $j$  cannot be done on machine  $i$

each machine can only do one job and we wish to determine the optimal match, i.e., the assignment with the lowest total costs of doing all the jobs  $j$  on the  $n$  machines available

# ASSIGNMENT PROBLEM

---

- ❑ The brute force approach is simply enumeration:

consider  $n = 10$  and there are 3,628,800 possible choices!

cuu duong than cong. com

- ❑ We can, however, introduce *categorical* decision variables

$$x_{ij} = \begin{cases} 1 & \text{job } j \text{ is assigned to machine } i \\ 0 & \text{otherwise} \end{cases}$$

cuu duong than cong. com

# ASSIGNMENT PROBLEM

---

and the problem constraints can be stated as

$$\sum_{j=1}^n x_{ij} = 1 \quad \forall i \quad \text{each machine does exactly 1 job}$$

$$\sum_{i=1}^n x_{ij} = 1 \quad \forall j \quad \text{each job is assigned}$$

to only 1 machine

□ The objective, then, is

$$\min Z = \sum_{i=1}^n \sum_{j=1}^n c_{ij} x_{ij}$$

# ASSIGNMENT PROBLEM

---

□ This assignment problem is a standard

transportation problem with

cuu duong than cong. com

$$a_i = 1 \quad \forall i$$

$$b_j = 1 \quad \forall j$$

cuu duong than cong. com

$$\sum_{i=1}^n a_i = \sum_{j=1}^n b_j$$

# NONSTANDARD ASSIGNMENT PROBLEM

---

- Suppose we have  $m$  machines and  $n$  jobs with  $m \neq n$
- We may convert this into an equivalent *standard assignment problem* with *equal* number of machines and jobs
- The conversion requires the introduction of either *fictitious* jobs or *fictitious* machines

# NONSTANDARD ASSIGNMENT PROBLEM

---

□ In the case  $m > n$  :

we create  $(m - n)$  fictitious jobs and we have  $m$  machines and  $n + m - n = m$  jobs; we assign the machinery costs for the fictitious goods to be  $0$  : note that there is no change in the objective function since a fictitious job assigned to a machine is, in effect, a machine that is *idle*

# NONSTANDARD ASSIGNMENT PROBLEM

---

□ For the case  $n > m$  :

we create  $(n - m)$  *fictitious* machines with

cuu duong than cong. com

machine costs of  $0$  and the solution

obtained has the  $(n - m)$  jobs that cannot be

cuu duong than cong. com

done due to lack of machines

# NONSTANDARD ASSIGNMENT PROBLEM

---

- ❑ In principle, any assignment problem may be solved using the transportation problem technique; in practice, this is not good since there exists *degeneracy* in every basic feasible solution
- ❑ We note that in the *standard assignment problem* for  $m$  machines with  $m = n$ , there are exactly  $m$   $x_{ij}$  that are 1 (nonzero) but every basic feasible solution of the transportation problem has  $(2m - 1)$  basic variables and therefore contains  $(m - 1)$  zero valued basic variables
