which says that the work done by the force field along \mathcal{C} is equal to the change in kinetic energy at the endpoints of \mathcal{C} .

Now let's further assume that **F** is a conservative force field; that is, we can write $\mathbf{F} = \nabla f$. In physics, the **potential energy** of an object at the point (x, y, z) is defined as P(x, y, z) = -f(x, y, z), so we have $\mathbf{F} = -\nabla P$. Then by Theorem 2 we have

$$W = \int_{C} \mathbf{F} \cdot d\mathbf{r} = -\int_{C} \nabla P \cdot d\mathbf{r} = -[P(\mathbf{r}(b)) - P(\mathbf{r}(a))] = P(A) - P(B)$$

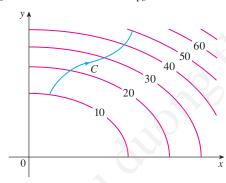

Comparing this equation with Equation 16, we see that

$$P(A) + K(A) = P(B) + K(B)$$

which says that if an object moves from one point A to another point B under the influence of a conservative force field, then the sum of its potential energy and its kinetic energy remains constant. This is called the **Law of Conservation of Energy** and it is the reason the vector field is called *conservative*.
