# The Basic Data Types

- **char**
- **int**
- **float**
- **double**
- **void**

[Cuu duong than cong . com](http://CuuDuongThanCong.com)

# Modifying the Basic Types

- **signed**
- **unsigned**
- **long**
- **short**

[cuu duong than cong . com](https://www.cplusplus.com)

# Table 2-1. All Data Types Defined by the C Standard

Type	Typical Size in Bits	Minimal Range
char	8	-127 to 127
unsigned char	8	0 to 255
signed char	8	-127 to 127
int	16 or 32	-32,767 to 32,767
unsigned int	16 or 32	0 to 65,535
signed int	16 or 32	Same as <b>int</b>
short int	16	-32,767 to 32,767
unsigned short int	16	0 to 65,535
signed short int	16	Same as <b>short int</b>

# Table 2-1. All Data Types Defined by the C Standard (cont.)

long int	32	$-2,147,483,647$ to $2,147,483,647$
long long int	64	$-(2^{63} - 1)$ to $2^{63} - 1$ (Added by C99)
signed long int	32	Same as <b>long int</b>
unsigned long int	32	0 to 4,294,967,295
unsigned long long int	64	$2^{64} - 1$ (Added by C99)
float	32	$1E-37$ to $1E+37$ with six digits of precision
double	64	$1E-37$ to $1E+37$ with ten digits of precision
long double	80	$1E-37$ to $1E+37$ with ten digits of precision

# Identifier Names

- The names of variables, functions, labels, and various other user-defined items are called *identifiers*.
- The length of these identifiers can vary from one to several characters.
- The first character must be a letter or an underscore, and subsequent characters must be either letters, digits, or underscores.

# Variables

*type variable\_list;*

```
int i, j, l;  
short int si;  
unsigned int ui;  
double balance, profit, loss;
```

# Where Variables Are Declared

- Variables can be declared in three places: inside functions, in the definition of function parameters, and outside of all functions.
- These positions correspond to *local variables*, *formal parameters*, and *global variables*, respectively.

# Local Variables

- Variables that are declared inside a function are called *local variables*.
- Local variables exist only while the *block of code* in which they are declared is executing.

```
void func1(void)
{
    int x;

    x = 10;
}

void func2(void)
{
    int x;

    x = -199;
}
```

# Formal Parameters

- If a function is to use *arguments*, it must declare variables that will accept the values of the arguments.
- These variables are called the *formal parameters* of the function.
- They behave like any other local variables inside the function.

# Global Variables

- *Global variables* are known throughout the program and may be used by any piece of code.
- Storage for global variables is in a fixed region of memory set aside for this purpose by the compiler.

```

1 #include <stdio.h>
2 int count; /* count is global */
3
4 void func1(void);
5 void func2(void);
6
7 int main(void)
8 {
9     count = 100;
10    func1();
11
12    return 0;
13 }
14
15 void func1(void)
16 {
17     int temp;
18
19     temp = count;
20     func2();
21     printf("count is %d", count); /* will print 100 */
22 }
23
24 void func2(void)
25 {
26     int count;
27
28     for(count=1; count<10; count++)
29         putchar('.');
30 }

```

# The Four C Scopes

- File scope
- Block scope
- Function prototype Scope
- Function scope

# Variable Initializations

*type variable\_name = constant;*

```
char ch = 'a';  
int first = 0;  
double balance = 123.23;
```

# Constants

- Constants refer to fixed values that the program may not alter.

## Data Type

## Constant Examples

int

1 123 21000 -234

long int

35000L -34L

unsigned int

10000U 987u 40000U

float

123.23F 4.34e-3f

double

123.23 1.0 -0.9876324

long double

1001.2L

# Operators

- Arithmetic
- Relational
- Logical
- Bitwise

[cuu duong thanh cong . com](https://www.cuu-duong-thanh-cong.com)

# The Assignment Operator

- `variable_name = expression;`
- When variables of one type are mixed with variables of another type, a *type conversion* will occur.

```
int x;
char ch;
float f;

void func(void)
{
    ch = x;          /* line 1 */
    x = f;          /* line 2 */
    f = ch;         /* line 3 */
    f = x;          /* line 4 */
}
```

<b>Target Type</b>	<b>Expression Type</b>	<b>Possible Info Loss</b>
signed char	char	If value > 127, target is negative
char	short int	High-order 8 bits
char	int (16 bits)	High-order 8 bits
char	int (32 bits)	High-order 24 bits
char	long int	High-order 24 bits
short int	int (16 bits)	None
short int	int (32 bits)	High-order 16 bits
int (16 bits)	long int	High-order 16 bits
int (32 bits)	long int	None
long int (32 bits)	long long int (64 bits)	High-order 32 bits (applies to C99 only)
int	float	Fractional part and possibly more
float	double	Precision, result rounded
double	long double	Precision, result rounded

# Compound Assignments

- `x += 10;`

- The operator `+=` tells the compiler to assign to `x` the value of `x` plus 10.

- `var = var operator expression`  
can be rewritten as  
`var operator = expression`

# Arithmetic Operators

- %: the remainder of an integer division. However, you cannot use it on floating-point types.

```
int x, y;  
  
x = 5;  
y = 2;  
  
printf("%d ", x/y); /* will display 2 */  
printf("%d ", x%y); /* will display 1, the remainder of  
the integer division */
```

```
x = 1;  
y = 2;  
  
printf("%d %d", x/y, x%y); /* will display 0 1 */
```

# Arithmetic Operators

Operator	Action
—	Subtraction, also unary minus
+	Addition
*	Multiplication
/	Division
%	Modulus
—	Decrement
++	Increment

# The Precedence of the Arithmetic Operators

**Highest**

++ - -

- (unary minus)

\* / %

**Lowest**

+ -

# Relational and Logical Operators

- In C, true is any value other than zero. False is zero.
- The truth table for the *logical operators* is shown here using 1's and 0's.

<b>p</b>	<b>q</b>	<b>p &amp;&amp; q</b>	<b>p    q</b>	<b>!p</b>
0	0	0	0	1
0	1	0	1	1
1	1	1	1	0
1	0	0	1	0

# Relational and Logical Operators

## Relational Operators

Operator	Action
>	Greater than
>=	Greater than or equal
<	Less than
<=	Less than or equal
==	Equal
!=	Not equal

## Logical Operators

Operator	Action
&&	AND
	OR
!	NOT

# Bitwise Operators

- *Bitwise operation* refers to testing, setting, or shifting the actual bits.

## Operator

&

|

^

~

>>

<<

## Action

AND

OR

Exclusive OR (XOR)

One's complement (NOT)

Shift right

Shift left

# Expressions

- An *expression* in C is any valid combination of operators, constants, functions, and variables.
- Most expressions tend to follow the general rules of algebra.

# Order of Evaluation

Highest

() [] ->.

! ~ ++ --- (type) \* & sizeof

\* / %

&

+ -

^

<< >>

|

< <= > >=

&&

== !=

||

?:

= += -= \*= /= etc.

Lowest

# Type Conversion in Expressions

- The compiler converts all operands up to the type of the largest operand, which is called *type promotion*.
- All `char` and `short int` values are automatically elevated to `int`.

IF an operand is a **long double**  
THEN the second is converted to **long double**  
ELSE IF an operand is a **double**  
THEN the second is converted to **double**  
ELSE IF an operand is a **float**  
THEN the second is converted to **float**  
ELSE IF an operand is an **unsigned long**  
THEN the second is converted to **unsigned long**  
ELSE IF an operand is **long**  
THEN the second is converted to **long**  
ELSE IF an operand is **unsigned int**  
THEN the second is converted to **unsigned int**

# A Type Conversion Example

# Casts

- You can force an expression to be of a specific type by using a *cast*.
- The general form of a cast is  
**(type) expression**

```
(float) x/2
```
