

Chapter 9

Internet Control Message Protocol

Objectives

Upon completion you will be able to:

- *Be familiar with the ICMP message format*
- *Know the types of error reporting messages*
- *Know the types of query messages*
- *Be able to calculate the ICMP checksum*
- *Know how to use the ping and traceroute commands*
- *Understand the modules and interactions of an ICMP package*

Figure 9.1 *Position of ICMP in the network layer*

Figure 9.2 *ICMP encapsulation*

9.1 TYPES OF MESSAGES

ICMP messages are divided into error-reporting messages and query messages. The error-reporting messages report problems that a router or a host (destination) may encounter. The query messages get specific information from a router or another host.

cuu duong than cong . com

cuu duong than cong . com

Figure 9.3 *ICMP messages*

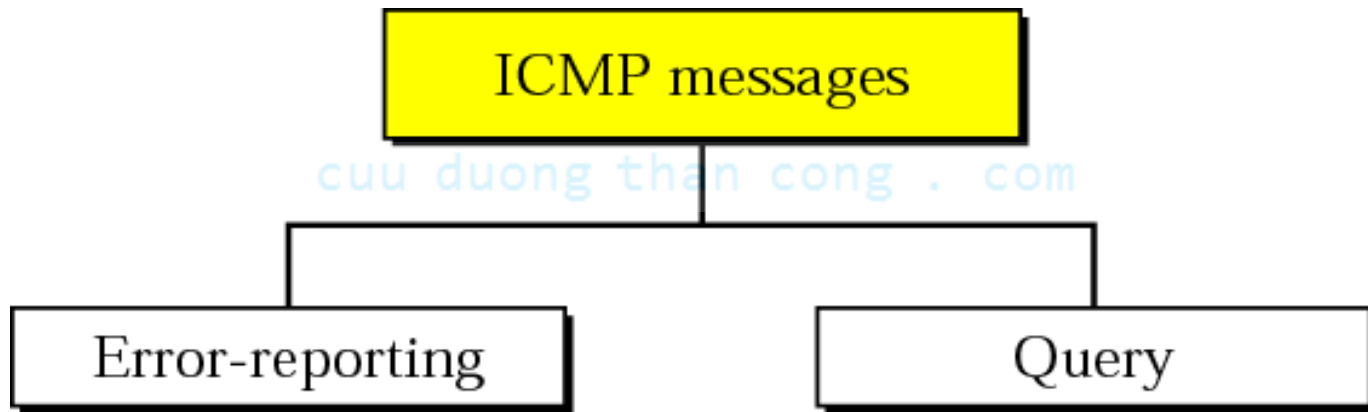

Table 9.1 ICMP messages

<i>Category</i>	<i>Type</i>	<i>Message</i>
Error-reporting messages	3	Destination unreachable
	4	Source quench
	11	Time exceeded
	12	Parameter problem
	5	Redirection
Query messages	8 or 0	Echo request or reply
	13 or 14	Timestamp request or reply
	17 or 18	Address mask request or reply
	10 or 9	Router solicitation or advertisement

9.2 MESSAGE FORMAT

An ICMP message has an 8-byte header and a variable-size data section. Although the general format of the header is different for each message type, the first 4 bytes are common to all.

cuu duong than cong . com

cuu duong than cong . com

Figure 9.4 *General format of ICMP messages*

9.3 ERROR REPORTING

IP, as an unreliable protocol, is not concerned with error checking and error control. ICMP was designed, in part, to compensate for this shortcoming. ICMP does not correct errors, it simply reports them.

cuu duong than cong . com

The topics discussed in this section include:

Destination Unreachable

Source Quench

Time Exceeded

Parameter Problem

Redirection

cuu duong than cong . com

Note:

***ICMP always reports error messages
to the original source.***

cuu duong than cong . com

Figure 9.5 *Error-reporting messages*

Note:

The following are important points about ICMP error messages:

- ❑ No ICMP error message will be generated in response to a datagram carrying an ICMP error message.***
- ❑ No ICMP error message will be generated for a fragmented datagram that is not the first fragment.***
- ❑ No ICMP error message will be generated for a datagram having a multicast address.***
- ❑ No ICMP error message will be generated for a datagram having a special address such as 127.0.0.0 or 0.0.0.0.***

Figure 9.6 *Contents of data field for the error messages*

Figure 9.7 *Destination-unreachable format*

Note:

*Destination-unreachable messages with codes 2 or 3 can be created only by the **destination host**.*

*Other destination-unreachable messages can be created only by **routers**.*

Note:

***A router cannot detect all problems
that prevent the delivery of a packet.***

cuu duong than cong . com

Note:

There is no flow-control mechanism in the IP protocol.

cuu duong than cong . com

Figure 9.8 *Source-quench format*

Note:

A source-quench message informs the source that a datagram has been discarded due to congestion in a router or the destination host.

The source must slow down the sending of datagrams until the congestion is relieved.

Note:

One source-quench message is sent for each datagram that is discarded due to congestion.

cuu duong than cong . com

Note:

Whenever a router decrements a datagram with a time-to-live value to zero, it discards the datagram and sends a time-exceeded message to the original source.

Note:

When the final destination does not receive all of the fragments in a set time, it discards the received fragments and sends a time-exceeded message to the original source.

Note:

*In a time-exceeded message, **code 0** is used only by routers to show that the value of the time-to-live field is zero. **Code 1** is used only by the destination host to show that not all of the fragments have arrived within a set time.*

Figure 9.9 *Time-exceeded message format*

Note:

A parameter-problem message can be created by a router or the destination host.

cuu duong than cong . com

Figure 9.10 *Parameter-problem message format*

Type: 12	Code: 0 or 1	Checksum
Pointer	Unused (All 0s)	
Part of the received IP datagram including IP header plus the first 8 bytes of datagram data		

Figure 9.11 *Redirection concept*

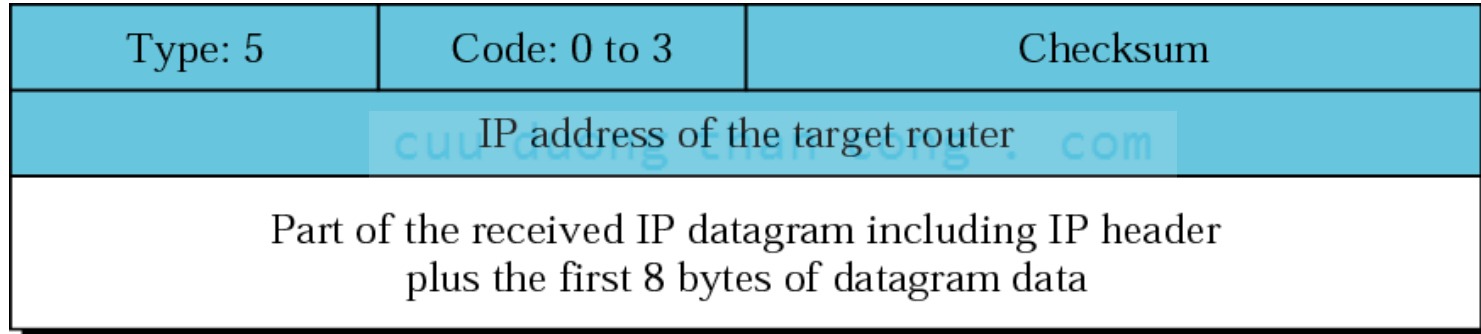

Note:

A host usually starts with a small routing table that is gradually augmented and updated. One of the tools to accomplish this is the redirection message.

Figure 9.12 *Redirection message format*

Note:

A redirection message is sent from a router to a host on the same local network.

cuu duong than cong . com

9.4 QUERY

ICMP can also diagnose some network problems through the query messages, a group of four different pairs of messages. In this type of ICMP message, a node sends a message that is answered in a specific format by the destination node.

cuu duong than cong . com

The topics discussed in this section include:

Echo Request and Reply

Timestamp Request and Reply

Address-Mask Request and Reply

Router Solicitation and Advertisement

Figure 9.13 *Query messages*

Note:

An echo-request message can be sent by a host or router. An echo-reply message is sent by the host or router which receives an echo-request message.

Note:

Echo-request and echo-reply messages can be used by network managers to check the operation of the IP protocol.

cuu duong than cong . com

Note:

*Echo-request and echo-reply messages can test the reachability of a host. This is usually done by invoking the **ping** command.*

cuu duong than cong . com

Figure 9.14 *Echo-request and echo-reply messages*

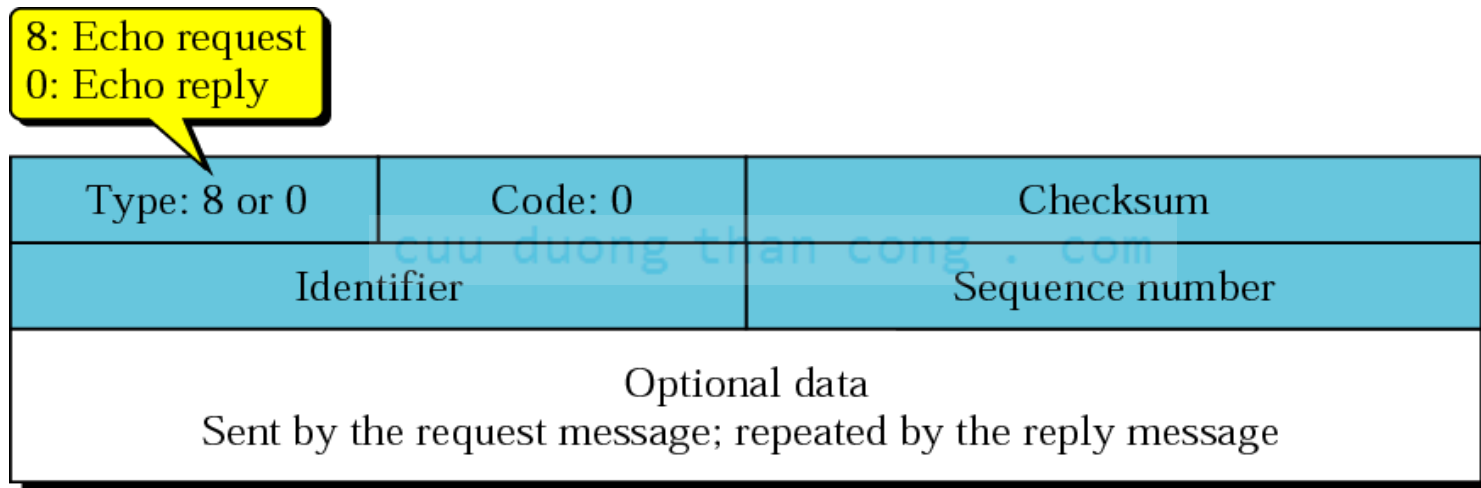

Figure 9.15 *Timestamp-request and timestamp-reply message format*

Note:

Timestamp-request and timestamp-reply messages can be used to calculate the round-trip time between a source and a destination machine even if their clocks are not synchronized.

Note:

The timestamp-request and timestamp-reply messages can be used to synchronize two clocks in two machines if the exact one-way time duration is known.

Figure 9.16 *Mask-request and mask-reply message format*

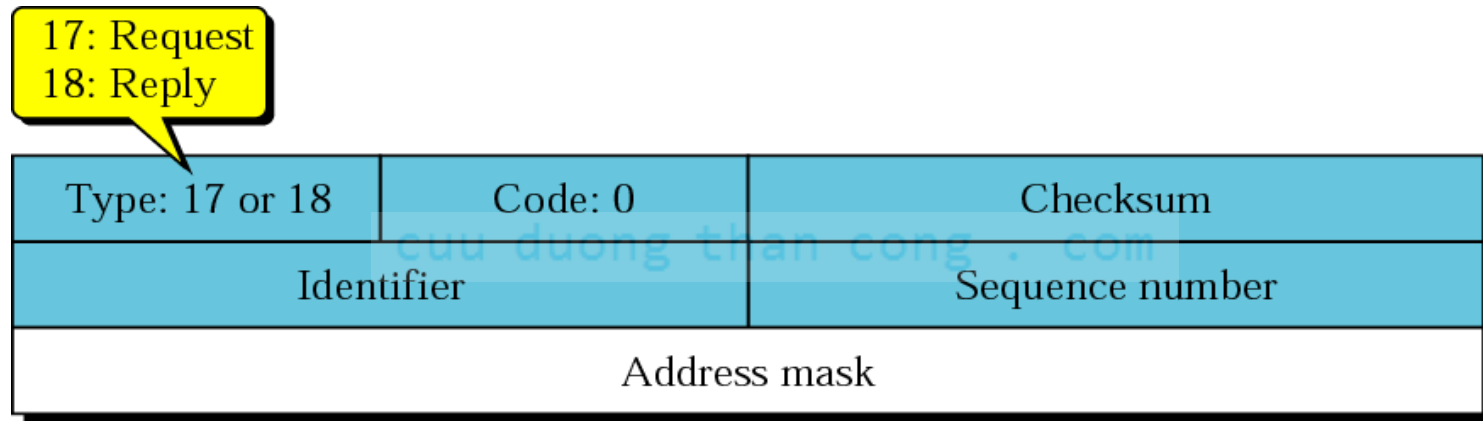

Figure 9.17 *Router-solicitation message format*

Type: 10	Code: 0	Checksum
Identifier		Sequence number

Figure 9.18 *Router-advertisement message format*

Type: 9	Code: 0	Checksum
Number of addresses	Address entry size	Lifetime
Router address 1		
Address preference 1		
Router address 2		
Address preference 2		
• • •		

9.5 CHECKSUM

In ICMP the checksum is calculated over the entire message (header and data).

cuu duong than cong . com

The topics discussed in this section include:

Checksum Calculation

Checksum Testing

cuu duong than cong . com

EXAMPLE 1

Figure 9.19 shows an example of checksum calculation for a simple echo-request message (see Figure 9.14). We randomly chose the identifier to be 1 and the sequence number to be 9. The message is divided into 16-bit (2-byte) words. The words are added together and the sum is complemented. Now the sender can put this value in the checksum field.

See Next Slide

Figure 9.19 *Example of checksum calculation*

9.6 DEBUGGING TOOLS

*We introduce two tools that use ICMP for debugging: **ping** and **traceroute**.*

cuu duong than cong . com

The topics discussed in this section include:

Ping

Traceroute

cuu duong than cong . com

EXAMPLE 2

We use the ping program to test the server fhda.edu. The result is shown below:

```
$ ping fhda.edu
```

```
PING fhda.edu (153.18.8.1) 56 (84) bytes of data.
```

```
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=0 ttl=62 time=1.91 ms
```

```
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=1 ttl=62 time=2.04 ms
```

```
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=2 ttl=62 time=1.90 ms
```

```
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=3 ttl=62 time=1.97 ms
```

```
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=4 ttl=62 time=1.93 ms
```

See Next Slide

EXAMPLE 2 (CONTINUED)

64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=5 ttl=62 time=2.00 ms
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=6 ttl=62 time=1.94 ms
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=7 ttl=62 time=1.94 ms
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=8 ttl=62 time=1.97 ms
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=9 ttl=62 time=1.89 ms
64 bytes from tiptoe.fhda.edu (153.18.8.1): icmp_seq=10 ttl=62 time=1.98 ms

--- fhda.edu ping statistics ---

11 packets transmitted, 11 received, 0% packet loss, time 10103ms

rtt min/avg/max = 1.899/1.955/2.041 ms

EXAMPLE 3

For the this example, we want to know if the adelphia.net mail server is alive and running. The result is shown below:

\$ ping mail.adelphia.net

PING mail.adelphia.net (68.168.78.100) 56(84) bytes of data.

64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=0 ttl=48 time=85.4 ms

64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=1 ttl=48 time=84.6 ms

64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=2 ttl=48 time=84.9 ms

64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=3 ttl=48 time=84.3 ms

64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=4 ttl=48 time=84.5 ms

See Next Slide

EXAMPLE 3 (CONTINUED)

64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=5 ttl=48 time=84.7 ms
64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=6 ttl=48 time=84.6 ms
64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=7 ttl=48 time=84.7 ms
64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=8 ttl=48 time=84.4 ms
64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=9 ttl=48 time=84.2 ms
64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=10 ttl=48 time=84.9 ms
64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=11 ttl=48 time=84.6 ms
64 bytes from mail.adelphia.net (68.168.78.100): icmp_seq=12 ttl=48 time=84.5 ms

--- mail.adelphia.net ping statistics ---

14 packets transmitted, 13 received, 7% packet loss, time 13129ms
rtt min/avg/max/mdev = 84.207/84.694/85.469

Figure 9.20 *The traceroute program operation*

EXAMPLE 4

We use the traceroute program to find the route from the computer voyager.deanza.edu to the server fhda.edu. The following shows the result:

\$ traceroute fhda.edu

traceroute to fhda.edu (153.18.8.1), 30 hops max, 38 byte packets

1 Dcore.fhda.edu (153.18.31.254) 0.995 ms 0.899 ms 0.878 ms

2 Dbackup.fhda.edu (153.18.251.4) 1.039 ms 1.064 ms 1.083 ms

3 tiptoe.fhda.edu (153.18.8.1) 1.797 ms 1.642 ms 1.757 ms

See Next Slide

EXAMPLE 4 (CONTINUED)

The un-numbered line after the command shows that the destination is **153.18.8.1**. The TTL value is 30 hops. The packet contains 38 bytes: 20 bytes of IP header, 8 bytes of UDP header, and 10 bytes of application data. The application data is used by traceroute to keep track of the packets.

The first line shows the first router visited. The router is named Dcore.fhda.edu with IP address **153.18.31.254**. The first round trip time was 0.995 milliseconds, the second was 0.899 milliseconds, and the third was 0.878 milliseconds.

The second line shows the second router visited. The router is named Dbackup.fhda.edu with IP address **153.18.251.4**. The three round trip times are also shown.

The third line shows the destination host. We know that this is the destination host because there are no more lines. The destination host is the server fhda.edu, but it is named tiptoe. fhda.edu with the IP address **153.18.8.1**. The three round trip times are also shown.

EXAMPLE 5

In this example, we trace a longer route, the route to xerox.com

\$ traceroute xerox.com

traceroute to xerox.com (13.1.64.93), 30 hops max, 38 byte packets

1 Dcore.fhda.edu (153.18.31.254) 0.622 ms 0.891 ms 0.875 ms

2 Ddmz.fhda.edu (153.18.251.40) 2.132 ms 2.266 ms 2.094 ms

...

18 alpha.Xerox.COM (13.1.64.93) 11.172 ms 11.048 ms 10.922 ms

Here there are 17 hops between source and destination. Note that some round trip times look unusual. It could be that a router is too busy to process the packet immediately.

EXAMPLE 6

An interesting point is that a host can send a traceroute packet to itself. This can be done by specifying the host as the destination. The packet goes to the loopback address as we expect.

\$ traceroute voyager.deanza.edu

*traceroute to voyager.deanza.edu (127.0.0.1), 30 hops max, 38 byte packets
1 voyager (127.0.0.1) 0.178 ms 0.086 ms 0.055 ms*

EXAMPLE 7

Finally, we use the traceroute program to find the route between fhda.edu and mhhe.com (McGraw-Hill server). We notice that we cannot find the whole route. When traceroute does not receive a response within 5 seconds, it prints an asterisk to signify a problem, and then tries the next hop..

\$ traceroute mhhe.com

traceroute to mhhe.com (198.45.24.104), 30 hops max, 38 byte packets

1 Dcore.fhda.edu (153.18.31.254) 1.025 ms 0.892 ms 0.880 ms

2 Ddmz.fhda.edu (153.18.251.40) 2.141 ms 2.159 ms 2.103 ms

3 Cinic.fhda.edu (153.18.253.126) 2.159 ms 2.050 ms 1.992 ms

...

*16 * * **

*17 * * **

.....

9.7 ICMP PACKAGE

To give an idea of how ICMP can handle the sending and receiving of ICMP messages, we present our version of an ICMP package made of two modules: an input module and an output module.

cuu duong than cong . com

The topics discussed in this section include:

Input Module

Output Module

cuu duong than cong . com

Figure 9.21 *ICMP package*
